

DIFFERENT WAYS OF PUTTING STOPLOSS

By Jaynesh Kasliwal

NOTE

- In all my charts
- Red line is 21 ema
- Green line is 50 ema
- MACD as normal settings

WHAT IS STOP LOSS ?

- Name Itself suggests STOP LOSS
- Stop-losses prevent large and uncontrollable losses in volatile trades.
- It is to limit the losses so that we are alive to take the trade on next day

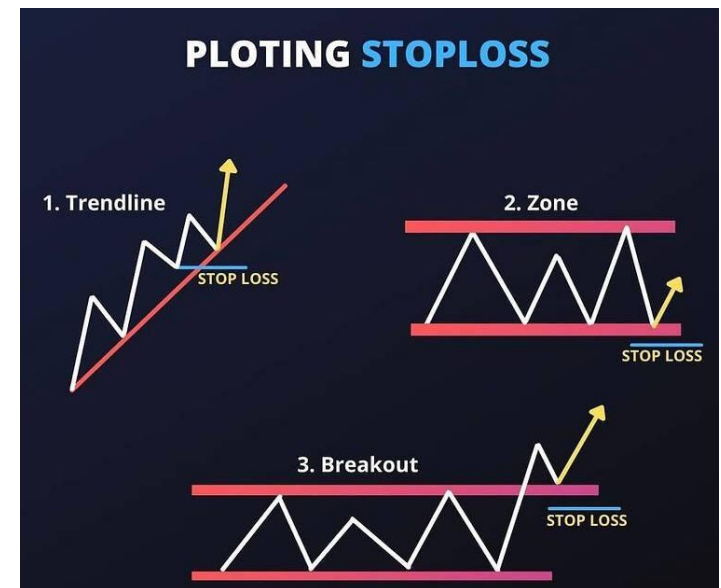

- If you're not using stop-losses, it's only a matter of time when a large losing position will get out of control and wipe out most of your trading profits, eventually even your entire account!
- Stop-losses also play a major role in risk management. Depending on their stop-loss, traders are calculating what position size to take, how much money to risk on a single trade,

5 METHODS OF PUTTING STOP LOSS

- Stoploss Below Support
- Moving Averages Stoploss
- Horizontal Stop loss
- Trendline StopLoss
- Supertrend StopLoss

1. STOPLOSS BELOW SUPPORT

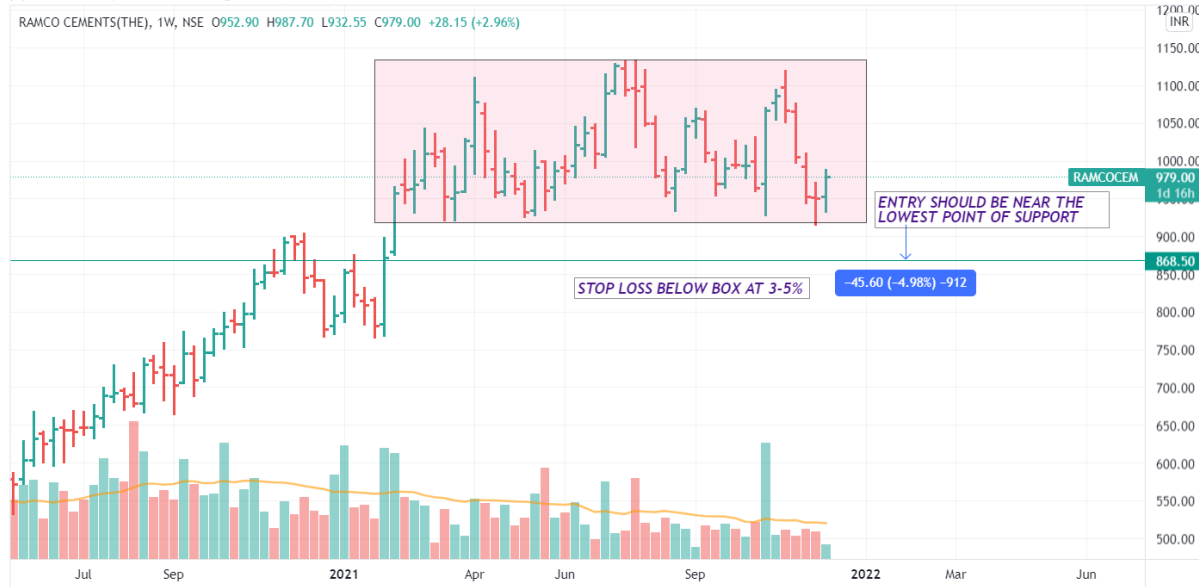

- Most common method of putting stoploss is below the horizontal support .
- If the buyer demand is strong the stock generally takes support on near this area.
- This is purely based on supply and demand of that stock
- Supports also break during weak markets and hence we need to apply stops to reduce losses

RULES FOR USING THIS METHOD

- Use strong supports as stoploss where there has been a long consolidation
- Stock should be in sideways trend of 4 to 8 weeks for a proper base formation .
- Ideally in such cases your buy point should be near lower end of box or support to reduce the stop at min .
- Keep stop loss at 5-8% below support to have room for volatility .
- In the end it depends upon your buypoint

TradingView

2. SUPPORT BELOW RETEST: HORIZONTAL

- A concept of Reversal of Polarity
- Resistance after being broken becomes support and Support after being broken becomes resistance
- A general pullback where the strength of buyers is checked and if strong stock generally reverses .
- Sometime a stock may fall a little below the level and hence room for volatility should be given of around 5 to 7%

KEI INDUSTRIES, 1D, NSE O1176.00 H1225.00 L1161.35 C1184.55 +15.90 (+1.36%)

MOVING AVERAGE STOPLOSS

- The “well known” moving averages, such as the **50, 100, 200 daily** moving averages act as natural support and resistance.
- 21 ema Momentum Trades
- 50 ema short term trades
- 200 ema positional trades
- 200 Weekly ema Long term trades

Can be used as trailing stoploss

MOVING AVERAGES IN THIS CHARTS

- 21 : Red
 - 50 : Green
 - 200 : Black
-
- Shouldn't be used in sideways stocks , either it should be clear uptrend or clear downtrend

200 WEEKLY EMA

- A fundamentally strong will generally stay over weekly 200 ema .
- This can a stop loss for your investment which are above 5+ years
- There can a period where you may get stopped out and need to reenter but that is small price to pay for saving big losses
- This can be a life saving tool during consolidation period where stock doesn't give return for many years

RESISTANCE AHEAD

MADE A TOP

RETEST OF BREAKDOWN

SUPERTREND

- Supertrend uses the concept of ATR or Average True Range. ATR is yet another indicator that gives you market volatility value
- It is multiplied by some factors to generate buy sell signals .
- It works really well in trending market and not advised In sideways trend

WHEN A CLEAR TREND IS ESTABLISHED
