Introduction to Astrological and Technical Trading of Stocks and Commodities

I am going to assume for the purposes of this book that everyone is a beginner to both the markets and astrology. Also that they have a small sized starting account currently but would like to get most of their income from this account in the future.

In this book I hope to prove to you that astrological cycles are a valid form of market analysis that can give you the edge you need to be constantly profitable. As well as the astrological cycles I will show you some simple price charting techniques that I have found to be very useful.

These cycles are the most basic and serve as an introduction. You can add more complex analytical routines, as you become more skillful.

When studying this book don't try and learn everything on the first reading, scan through and see what is appealing to you. This is a book of ideas, you must check for yourself to see if the cycle you're interested in continues to be valid.

At the end of the book is a glossary of astrological terms for your reference.

If you are going to discover the truth you will have to throw away preconceived notions about measuring time and start from the beginning. If you know something about traditional astrology already my advice would be to start again in Financial Astrology as it is different from what you are use to working with.

You will find that there are many, very reliable cycles based on the fixed positions of the planets and also when they are at certain distances from other planets (aspects) I suggest that you get to know one or two particular cycles for any Stock or Commodity in detail, prove to yourself its validity and then trade it as a separate system. Entry rules should be simple such as a break from a trading range or of a trend line.

Ninety Percent of my trading is now based on these Astrological cycles and that is because the longer I have spent working with them the more confidence I have in their effectiveness.

The solar system can be viewed in two ways. The original form was as seen from earth (geocentric) and then once it was discovered that the earth went around the Sun (heliocentric) both methods are used, and surprisingly, geocentric is equally effective.

When viewed from earth at certain times of the year planets appear to go backwards, this results in the apparent slowing down and speeding up of the planets compared to the more regular path of the Sun centered heliocentric view.

The following chart is of heliocentric Mercury. Note that the speed angle is steep.

The fast almost vertical line on this chart is the Mercury heliocentric view.

This chart is of exactly the same time period but is the Mercury geocentric (from earth) view.

Notice how this is much slower, the dips in the line are when Mercury is appearing to go backwards across the sky (retrograde) and then the line turns up as Mercury then goes forward (direct)

The Planet and house symbols (glyphs) are placed on an Astro wheel that is drawn as a 360 degree circle.

The circle is then divided into 12 equal areas of 30 degrees.

These are the 12 star signs.

0-30 degrees Aries

30-60degrees Taurus

60-90 degrees Gemini

90-120 degrees Cancer

120-150 degrees Leo

150-180 degrees Virgo

180-210 degrees Libra

210-240 degrees Scorpio

240-270 degrees Sagittarius

270-300 degrees Capricorn

300-330 degrees Aquarius

330-360 degrees Pisces

Q	Sun	
R	Moon	
S	Mercury	88 Days
T	Venus	224 Days
U	Mars	1 Year, 322 Days
V	Jupiter	11 Years, 322 Days
W	Saturn	29 Years, 167 Days
X	Uranus	84 Years
Y	Neptune	164 Years, 167 Days
Z	Pluto	248 Years, 242 Days

Major Aspects

An aspect is the angle of separation between planets

Conjunction (0 degrees)

Neither harmonious or inharmonious, this aspect merges and intensifies the energies of two planets.

Sextile (60 degrees)

Harmonious aspect.

Square (90 degrees)

Inharmonious aspect causing tensions and obstacles.

Trine (120 degrees)

Harmonious aspect

Opposition (180 degrees)

Inharmonious aspect that creates dynamic tensions.

Minor Aspects.

Semi-Sextile (30 degrees)

A minor harmonious aspect.

Semi-Square (45 degrees)

A minor inharmonious aspect.

Sesquiquadrate (135 degrees)

A little more minor than Semi-Square.

Quincunx (150 degrees)

Minor inharmonious

The most important aspects for financial astrology are

Conjunction

Square

Trine

Opposition

Sextile

Fixed Cycles

A fixed cycle is the easiest cycle to work with. Every Stock or Commodity is sensitive to at least one planet crossing a particular degree of the Zodiac.

I will show you how to find these fixed cycles soon but first I would like to demonstrate a few examples for you on different markets so you can see how they may work.

The chart below is a weekly U.S. Bond chart it is marked with the degree where heliocentric Venus was at the time of the weekly close. These particular weeks were chosen because during those weeks Venus was hitting one of the sensitive degrees in the natal chart (birth) for U.S. Bond futures.

The exact cycle is heliocentric Venus at 56, 176 and 296 degrees.

Bonds can also change trend when Geocentric Mercury is conjunct, square or opposite Jupiter.

S+P Cash with Fixed Astro Cycles

How to find a fixed cycle for any market

It is much easier to process many markets quickly by using a fixed cycle.

The fixed cycle can be generated by using the natal chart. This chart may be from the first trade date of the contract, from a significant high or low or even from the time of an important event that was relevant to that market such as when a currency was taken off a peg and was allowed to free float.

To get a fixed cycle look for three things.

1 Venus degree

2 Mars degree

3 Planets that are conjunct, trine or square (within 3 degrees of orb or less)

First of all look at the position of Venus.

Note Venus' degree and find the trine points by adding 120 degrees.

i.e. Venus is at 1 degree plus $120 = 121$ this is a fixed cycle point.

Then $121 + 120 = 241$ this is another fixed cycle point

By adding another 120 results in 361 degrees which is back to the start at 1 degree. Next get the 90 degree points from Venus' start position, in this case they would be 91, 181 and 271 degrees.

In summary find the points 90, 120, 180, 240 and 270 degrees from the natal planets position which is found at the date of birth or significant high or low.

What should happen is that the next time Venus is in one of these positions the market should change trend. Some times the change is major but more often minor swings will develop at these points.

Next repeat the same process but using Mars instead of Venus.

The planets that are conjunct, trine or square (within 3 degrees of orb or less) may also create a fixed cycle when they are in aspect to each other again.

Look for in steps of 30 degrees between big planets such as Jupiter and Saturn or 90 and 120 degree separations between faster planets.

All these cycles should be checked against the commodity or stock that you are trading you may find that both Venus and Mars cycles will work well on one market for example but only Venus on an another or in some markets not at all.

When new major highs or lows are made in any market start fixed cycles from these points.

Fixed Cycles Found to be Useful

The following lists a few of the fixed cycles that I have found to be useful.

Swiss franc Mars 92, 182, 212, 272, 332, 2 degrees geocentric
Swiss franc Mercury conjunct Mars geocentric
Swiss franc Mars 30 degree steps from Jupiter geocentric
British pound Mars 30 degree steps from Uranus geocentric
Soybeans Mars geo 1936 natal 276 degrees (no other points)
Soybeans Mars geo 60, 124, 188, 252, 316 degrees (special cycle)
Soybeans Venus trine Saturn geocentric
Corn Mars geo (high July 12 1996) 80.86 degrees 171, 201, 261, 321, 351 degrees
S+P Mercury conjunct Sun geo
S+P Mercury 230, 110, 350 degrees geo
S+P Sun 45 degree steps from Saturn geo
S+P node in 90 degree steps from Mars geo
S+P Mercury 120 degrees Neptune geo
S+P Heliocentric Mercury 88, 178, 268, 358 degrees
S+P Sun trine Saturn geo
S+P Sun trine and square Jupiter geo
U.S. Bonds Venus Heliocentric 56, 176, 296 degrees
IBM (natal) Mars 30 degree steps from Jupiter geo
IBM Mars 30 degree steps to Uranus but only up to 60 degrees of Mars conjunct Uranus geo

Fixed cycles are also repeating aspects that have a correlation with trend changes either major or minor in specific markets. The charts that follow are of this type of fixed cycle.

The chart above shows Venus and Mars every time they apart in 30 degree steps (30, 60, 90 120, 150 etc) and is plotted over a price chart of the Australian Share Market Index.

Weekly Wheat showing Sun conjunct Saturn

Weekly Soybeans with heliocentric Venus conjunct or 120 degrees from Jupiter

Another type of Fixed cycle is when a planet changes from one sign into another.

This is called Ingress

The Ingress points are where the traditional zodiac signs begin.

The chart below shows Venus ingress plotted against the Australian Dollar.

Cash S+P.

The sloping line is Venus and the horizontal is the 30 degree zodiac points, when the two intersect it is at the ingress point. I have marked the last three ingress' on the right hand of the chart for clarity.

[illegible]

Planetary ingress of Venus and Mars are more often minor swings because they happen so frequently. A cycle that can produce larger swings is heliocentric Venus conjunct or 120 degrees from Uranus.

Larger swings have slightly more time leeway such as up to four days either side of the exact aspect. They are warnings to be prepared to take action. Entry methods can be faster moving averages or trend line breaks that confirm by price a change of trend.

Time by degrees refers to the Sun moving x amount of degrees. In essence this is calendar day counts rather than trading day counts. The Sun moves 360 degrees in a year and takes 365.25 days to do this. A time by degrees count of 30 is approximately 30 days.

Planets by Degrees

Planets by degrees is the concept of a planet moving x degrees either geocentric or heliocentric. When the bigger planets are used timing is approximate so other technical signals are needed for entry.

Retrograde - Direct Planets as a Cycle Timer

This is a simple technique that anyone can use. The planets when viewed from earth will at certain times appear to go backwards. This means that they will cover the same degree of the circle going forward (direct) and backwards (retrograde) and then direct again.

To use this in trading have a look at the degree of a planets position when a major swing high or low is made and then expect a reversal of trend when the planet again crosses this degree.

An example using Saturn retrograde / direct on the S+P.

Saturn was at 45.25 degrees while retrograde on October 18th 1999 which was a low. The next time that Saturn crossed this exact degree while direct was on the 28-29th of March 2000 with the actual high being on Friday the 24th of March giving us three trading days from the top.

Another example of retrograde / direct cycles for longer term forecasts. is seen in the chart of the British pound.

At point 1 Uranus is at 315.91 degrees while retrograde. At point 2 Uranus is again at 315.91 degrees while direct.

Jupiter was direct when the Deutsche Mark made its high. The cursor marks the day of the cash high. By the time the futures had opened price had pulled back but we will use this day as it was the real high of the 24 hour market.

Jupiter was direct at 254.49 degrees.

The next time Jupiter passed the same degree while retrograde and then direct are marked on the chart. As you can see each pass of Jupiter over the same degree created a good trade.

The S+P made its low while Saturn was at 7.4 degrees retrograde.

The S+P made a secondary high as Saturn passed over 7.84 degrees while Direct. The chart is marked at 7.46 the actual pass of 7.4 was during the night.

A cycle can create a break out situation and retrograde direct cycles are no exception.

Saturn returns to same degree as the low and triggers the break out.

Here is another example, this time using Corn.

Mars retrograde degree at the low was also the secondary high on December Corn when Mars crossed this same degree while direct. The curved line is Mars converted to longitude and overlaid on the price chart.

This time Mercury retrograde was a low on Soybeans. When Mercury crossed the same degree again it was the weekend, on the next trading day Soybeans made its high.

Reprint from The Ticker and Investment Digest

(Now known as The Wall Street Journal)

Vol. 5 DECEMBER 1909 No.2

William D. Gann

An Operator Whose Science and Ability Place Him in the Front Rank- His Remarkable Predictions and Trading Record.

Sometime ago the attention of this magazine was attracted by certain long pull stock market predictions which were being made by William D. Gann. In a large number of cases Mr. Gann gave us in advance the exact points at which certain stocks and commodities would sell, together with prices close to the then prevailing figures which would not be touched.

For instance, when New York Central was 131 he predicted that it would sell at 145 before 129.

So repeatedly did his figures prove to be accurate, and so different did his work appear from that of any expert whose methods we had examined, that we set about to investigate Mr. Gann and his way of figuring out these predictions, as well as the particular use which he was making of them in the market.

The results of this investigation are remarkable in many ways.

It appears to be a fact that Mr. Gann has developed an entirely new idea as to the principles governing stock market movements. He bases his operations upon certain natural laws which though existing since the world began, have only in recent years been subjected to the will of man, and added to the list of so-called discoveries.

We have asked Mr. Gann for an outline of his work, and have secured some remarkable evidence as to the results obtained therefrom. We submit this in full recognition of the fact that in Wall Street, a man with a new idea, an idea which violates the traditions and encourages a scientific view of the proposition is not usually welcomed by the majority, for the reason that he stimulates thought and research. These activities said majority abhors.

Mr. Gann's description of his experience and methods is given herewith. It should be read with a recognition of the established fact that Mr. Gann's predictions have proved correct in a large majority of instances.

"For the past ten years I have devoted my entire time and attention to the speculative markets.

Like many others, I lost thousands of dollars and experienced the usual ups and downs incidental to the novice who enters the market without preparatory knowledge of the subject.

"I soon began to realize that all successful men, whether lawyers, doctors, or scientists, devoted years of time to the study and investigation of their particular pursuit or profession before attempting to make any money out of it.

"Being in the brokerage business myself and handling large accounts, I had opportunities seldom afforded the ordinary man for studying the cause of success and failure in the speculations of others. I found that over ninety per cent of the traders who go into the market without knowledge or study usually lose in the end.

"I soon began to note the periodical recurrence of the rise and fall in stocks and commodities. This led me to conclude that natural law was the basis of market movements. I then decided to devote ten years of my life to the study of natural law as applicable to the speculative markets and to devote my best energies toward making speculation a profitable profession. After exhaustive researches and investigations of the known sciences, I discovered that the Law of Vibration enabled me to accurately determine the exact points to which stocks or commodities should rise and fall within a given time. The working out of this law determines the cause and predicts the effect long before the Street is aware of either. Most speculators can testify to the fact that it is looking at the effect and ignoring the cause that has produced their losses.

"It is impossible here to give an adequate idea of the Law of Vibration as I apply it to the markets, however, the layman may be able to grasp some of the principles when I state that the Law of Vibration is the fundamental law upon which wireless telegraphy, wireless telephone and phonographs are based. Without the existence of this law the above inventions would have been impossible.

"In order to test out the efficiency-of my idea I have not only put in years of labor in the regular way, but I spent nine months working night and day in the Astor Library of New York and in the British Museum of London, going over the records of stock transactions as far back as 1820. I have incidentally examined the manipulations of Jay Gould, Daniel Drew, Commodore Vanderbilt, and all the other important Wall Street manipulators from that time to the present day. I have examined every quotation of Union Pacific prior to and from the time of E.H. Harriman's securing control, and can say that of all the manipulations in the history of Wall Street, Mr. Harriman's was the most masterly. The figures show that, whether unconsciously or not, Mr. Harriman worked strictly in accordance with natural law.

"In going over the history of markets and the great mass of related statistics, it soon becomes apparent that certain laws govern the changes and variations in the value of stocks and there exists a periodic or cyclic law, which is at the back of all these movements. Observation has shown that there are regular periods of intense activity on the Exchange followed by periods of inactivity. Mr. Henry Hall, in his recent book devoted much space to 'Cycles of Prosperity and Depression' which he found recurring at regular intervals of time. The law which I have applied will not only give these long cycles or swings, but the daily and even hourly movements of stocks. By knowing the exact vibration of each individual stock I am able to determine at what point each will receive support and at what point the greatest resistance is to be met.

Those in close touch with the market have noticed the phenomena of ebb and flow, or rise and fall in the value of stocks. At certain times a stock will become practically stationary or inactive with a very small volume of sales. I have found that the Law of Vibration governs and controls these conditions. I have also found that certain phases of this law governs the rise in a stock and an entirely different rule operates on the decline.

"While Union Pacific. and other railroad stocks which made their high prices in August were declining, United States Steel common was steadily advancing. The Law of Vibration was at work, sending a particular stock on the upward trend, whilst others were trending downward.

"I have found that in the stock itself exists its harmonic or inharmonic relationship to the driving power or force behind it. The secret of all its activity is therefore apparent. By my method I can determine the vibration of each stock and by also taking certain time values into consideration I can in the majority of cases tell exactly what the stock will do under given conditions.

"The power to determine the trend of the market is due to my knowledge of the characteristics of each individual stock and a certain grouping of different stocks under their proper rates of vibration. Stocks are like electrons, atoms, and molecules, which hold persistently to their own individuality in response to the fundamental Law of Vibration. Science teaches 'that an original impulse of any kind finally resolves itself into periodic or rhythmical motion,' also 'just as the pendulum returns again in its swing, just as the moon returns in its orbit, just as the advancing year ever brings the roses of spring, so do the properties of the elements periodically recur as the weight of the atoms rises.'

"From my extensive investigations, studies and applied tests, I find that not only do the various stocks vibrate, but that the driving forces controlling the stocks are also in a state of vibration. These vibratory forces can only be known by the movements they generate on the stocks and their values in the market. Since all great swings or movements of the market are cyclic they act in accordance with periodic law.

"Science had laid down the principle that 'the properties of an element are a periodic function of its atomic weight.' A famous scientist has stated that 'we are brought to the conviction that diversity in phenomenal nature in its different kingdoms, is most intimately associated with numerical relationship. The numbers are not intermixed, chaotically and accidentally, but are subject to regular periodicity. The changes and developments are also seen to be in many cases undulatory.'

"Thus, I affirm, every class of phenomena, whether in nature or in the stock market, must be subject to the Universal Law of Causation and Harmony. Every effect must have an adequate cause.

"If we wish to avert failure in speculation we must deal with causes. Everything in existence is based on exact proportion and perfect relationship. There is no chance in nature, because mathematical principles of the highest order lie at the foundation of all things. Faraday said:

'There is nothing in the Universe but mathematical points of force.'

"Vibration is fundamental; nothing is exempt from this law; it is universal, therefore applicable to every class of phenomena on the globe.

"Through the Law of Vibration every stock in the market moves in its own distinctive sphere of activities, as to intensity, volume and direction; all the essential qualities of its evolution are characterized in its own rate of vibration. Stocks, like atoms, are really centers of energies, therefore they are controlled, mathematically. Stocks create their own field of action and power; power to attract and repel, which principle explains why certain stocks at times lead the market and 'turn dead' at other times. Thus to speculate scientifically it is absolutely necessary to follow natural law.

"After years of patient study I have proven to my entire satisfaction as well as demonstrated to others that vibration explains every possible phase and condition of the market."

In order to substantiate Mr. Gann's claims as to what he has been able to do under this method, we called upon Mr. William E. Gilley, an Inspector of Imports, 16 Beaver Street, New York. Mr. Gilley is well-known in the downtown district. He himself has studied stock market movements for twenty-five years, during which time he has examined every piece of market literature that has been issued and procurable in Wall Street. It was he who encouraged Mr. Gann to study out the scientific and mathematical possibilities of the subject. When asked what had been the most impressive of Mr. Gann's work and predictions, he replied as follows:

"It is very difficult for me to remember all the predictions and operations of Mr. Gann which may be classed as phenomenal, but the following are a few: In 1908

when Union Pacific was 168-1/8, he told me that it would not touch 169 before it had a good break. We sold it short all the way down to 152-5/8, covering on the weak spots and putting it out again on the rallies, securing twenty-three points profit out of an eighteen-point wave.

"He came to me when United States Steel was selling around 50 and said "This Steel will run up to 58 but it will not sell at 59. From there it should break 16-3/4 points. 'We sold it short around 58-3/4 with a stop at 59. The highest it went was 58 3/4. From there it declined to 41 1/4 - 17 1/2 points.

"At another time wheat was selling at about 89 cents. He predicted that the May option would sell at \$1.35. We bought it and made large profits on the way up. It actually touched \$1.35-1/2.

"When Union Pacific as 172, he said it would go to 187 7/8 but not an eighth higher until it had had a good break. It went to 184-7/8 and came back from there eight or nine times. We sold it short repeatedly with a stop at 185 and were never caught. It eventually came back to 172-1/2.

"Mr. Gann's calculations are based on natural law. I have followed his work closely for years. I know that he had a firm grasp of the basic principles which govern stock market movements and I do not believe any other man on earth can duplicate the idea or his method at the present time.

"Early this year he figures that the top of the advance would fall on a certain day in August and calculated the prices at which the Dow-Jones averages would then stand. The market culminated on the exact day and within four-tenths of one percent of the figures predicted."

"You and Mr. Gann must have cleaned up considerable money on all these operations," we suggested.

"Yes, we have made a great deal of money. He has taken half a million dollars out of the market in the past few years. I once saw him take \$130, and in less than one month run it up to over \$12,000. He can compound money faster than any man I ever met."

"One of the most astonishing calculations made by Mr. Gann was during last summer (1909) when he predicted that September wheat would sell at \$1.20. This meant that it must touch that figure before the end of the month of September. At twelve o'clock, Chicago time, on September 30th (the last day) the option was selling below \$1.08, and it looked as though his prediction would not be fulfilled. Mr. Gann said, 'If it does not touch \$1.20 by the close of the market it will prove that there is something wrong with my whole method of calculation. I do not care what the price is now, it must go there.' It is common history that September wheat surprised the

whole country by selling at \$1.20 and no higher in the very last hour of the trading, closing at that figure."

So much for what Mr. Gann has said and done as evidenced by himself and others. Now as to what demonstrations have taken place before our representative:

During the month of October, 1909, in twenty-five market days, Mr. Gann made, in the presence of our representative, two hundred and eighty-six transactions in various stocks, on both the long and short side of the market. Two hundred and sixty-four of these transactions resulted in profits, twenty-two in losses.

The capital with which he operated was doubled ten times, so that at the end of the month he had one thousand per cent on his original margin.

In our presence Mr. Gann sold Steel common short at 94-7/8, saying that it would not go to 95.
It did not.

On a drive which occurred during the week ending October 29, Mr. Gann bought Steel common at 86-1/4, saying that it would not go to 86. The lowest it sold was 86-1/8.

We have seen him give in one day sixteen successive orders in the same stock, eight of which turned out to beat either the top or the bottom eighth of that particular swing. The above we can positively verify.

Such performances as these, coupled with the foregoing, are probably unparalleled in the history of the Street.

James R. Keene has said, "The man who is right six times out of ten will make his fortune."

Here is a trader, who, without any attempt to make a showing (for he did not know the results were to be published), established a record of over ninety-two per cent profitable trades.

Mr. Gann has refused to disclose his method at any price, but to those scientifically inclined he has unquestionably added to the stock of Wall Street knowledge and pointed out infinite possibilities.

We have requested Mr. Gann to figure out for the readers of The Ticker a few of the most striking indications which appear in his calculations. In presenting these we wish it understood that no man, in or out of Wall Street, is infallible.

Mr. Gann's figures at present indicate that the trend of the stock market should, barring the usual rallies be toward lower prices until March or April, 1910.

He calculates that May wheat, which is now selling at \$1.02, should not sell below 99 cents and should sell at \$1.45 next spring.

On cotton, which is now at about the 15 cent level, he estimates that, after a good reaction from these prices, the commodity should reach 18 cents in the spring of 1910. He locks for a corner in the March or May option.

Whether these figures prove correct or not, will in no sense detract from the record which Mr. Gann has already established.

Mr. Gann was born in Lufkin, Texas, and is thirty-one years of age. He is a gifted mathematician, has an extraordinary memory for figures, and is an expert Tape Reader. Take away his science and he would beat the market on his intuitive tape reading alone.

Endowed as he is with such qualities, we have no hesitation in predicting that within a comparatively few years William D. Gann will receive full recognition as one of Wall Street's leading operators.

Note: - Since the above forecast was made, Cotton has suffered the expected decline, the extreme break having been 120 points. The lowest on May wheat thus far has been \$1.01-5/8. It is now selling at \$1.06-1/4.

Repeating aspects, Gann Planets and Soybeans

If you want to trade like Gann you have to learn his method and his method is the planets and their positions when highs and lows are made.

Gann used repeating aspects in 'Robert Gordons great Campaign in cotton' from his book 'The Tunnel thru the air'

He used the planets to form the same shape or pattern again that was observed at the markets high or low but used different planets to achieve this.

June 25th 1927.

October cotton declined to 16.80

Bought 500 October at 16.83 and 500 December at 17.15.

He figured that it would run up for about thirty days.

July 25th 1927.

Sold 500 October cotton at 19.00

Sold 500 December at 19.20

Went short 500 December at 19.20.

Decline followed as he expected.

To understand the reason for the timing of these trades just imagine a triangle and at each corner there is a planet. This is called a grand trine. What is happening in this case is that there are two slow planets that don't move much and they are 120 degrees apart(trine)

Then a fast planet, Mercury in this case comes around so that it forms a triangle with the other planets (at the low of the market) it moves away so that there is no grand trine anymore but a month later the Sun comes around to where Mercury use to be and forms the triangle again (at the high of the market)

So from the above you can see the planets form the same shape again but use different planets. The next example is from May soybeans. I will show you how an opposition with a conjunction in the middle was found at both the low and the high of the swing.

May soybeans had a low of 460 on 13th Dec 1999 and ended on 28th January 2000 at 538. On the hexagon chart 460 and 538 are beside each other.

On Dec 13th Mars was conjunct (joined with) Uranus, This was happening exactly at 90 degrees to Venus and Saturn which were both opposite each other.

This is what it looked like.

Low on Beans 13th December 1999

High on beans 28th January 2000

So here we have Mercury replacing Mars and the Moon replacing Venus. This was the only time in the whole price move where any planets could recreate the original pattern that was at the low, couple that with exact price targets and thus a swing was created in beans just as W.D.Gann said it would.

Repeating Aspects

Dow low Oct 18th 2000 Venus was opposite Saturn. The next planet that could oppose Saturn was Mercury, this did not cause a cycle. The final opposition possible was Mars opposite Saturn. This was a major turning point.

Repeating aspects

Repeating aspects

The Dow made its major high on January 14th 2000 with Sun conjunct Mercury square Moon conjunct Jupiter.

On March 22nd 2001 which was a multi month low, three of the original planets were again involved in a conjunction that was also square.

The Bradley Siderograph

The planets have been used as a market timing tool for many years. In the 1940's an American astrologer Donald Bradley developed a technique for combining the planets into a single line calculation that he hoped would indicate the major highs and lows for the year in the U.S. Stock Market.

This he named 'The Bradley Siderograph'

The details are published in his book 'Stock Market Prediction' subtitled 'The Planetary Barometer and How to Use It' available from Llewellyn Publications.

The basic formula for the calculation follows. You will see that it is very time consuming to do by hand but there are several computer programs that are available that will even allow you to change Bradleys formula, so that you can weight the inputs that you feel are the most relevant.

Bradleys basic formula is this, for every planet, measure the distance between that planet and every other planet (excluding the Moon), and see if it's within a 15 degree orb of a Conjunction, Sextile, Square, Trine, or Opposition. If so it is given a weighted value all depending on the aspect and it's distance from exact. Squares and oppositions are minus, sextiles and trines are plus, conjunctions have different weightings depending on the planets involved.

When there is an aspect within orb, take the distance between the two planets (in degrees), subtract the number from 15 and then divide the result by 15, next multiply the result by 10.

An aspect which is exact gets a value of 10 and 0 if at a 15 degree orb. The weightings increase as the aspect becomes more exact.

This calculation is done for 36 planetary combinations, excluding the Moon. The 36 combinations are separated into intermediate and long term cycles, with the 10 combinations of Jupiter through Pluto considered the long term, the other 26 represent the medium term cycles.

Next add the sum of the declinations of Venus and Mars, assign a positive value for northern declinations, negative for southern declinations. Add the values for both Venus and Mars and divide by two.

Add together all the long-term weights for the 10 long term cycles, (divided by two), and multiply this number by 4. Then add all the weights for the 26 intermediate term cycles and the Venus and Mars declination and this final number is the Siderograph on any one day.

The chart above shows the Bradley Siderograph from the heliocentric view. The lines with dates marked is the Bradley, the other is the S+P 500 Share Price Index.

Transits to Natal Charts

A Natal (Birth) chart can be created from several points in the market life of a commodity, stock or index. Such points would be the first trading day, the date of a major high or low, the incorporation date of a company or when there was major news that effected that entity such as a currency being allowed to free float as opposed to being of fixed value.

What we are looking for is a build up of energy from the current planets as they pass over or make angles to the natal chart.

One transit is not enough, I like to see at least three points on the natal chart that are being stimulated by the current planets transits.

Here are two real life examples from Soybeans.

The first chart is the 1997 Soybean high and the second chart is the Soybean high September 7th 1999. Chart three is an overlay of charts One and two showing their interlocking similarities.

There is a build up of important Super Timing patterns plus Saturn is transiting natal Sun (restriction) Mars transits natal Pluto (negative) Venus opposite natal Jupiter (negative)

The Sun conjunct Mercury is trine natal Sun, conjunct transiting Saturn and adding more power to the transit.

Soybean high September 7th 1999

Using the same 1997 high chart I predicted that May 5th would be another Soybean high, the actual high was May 3rd.

The reasons for this were because of the general look of energy to the combined natal-transit chart.

Once again there were strong Super Timing patterns on May 5th plus Jupiter was square its 1997 high and Uranus was now transiting Jupiter (negative) plus Sun-Jupiter was conjunct the natal Sun and trine the natal Mars. (normally positive)

Soybean high May 3 2000

IBM Low

Mars was opposite Jupiter at the high and is now trine.

The Sun takes up Mars position at the high by being opposite Jupiter making this a repeating aspect.

This move in IBM has been a combination of techniques, repeating aspects and transit to natal chart. This blend of techniques is fairly common.

In Summary there has to be a build up of energy to the natal chart from current transits plus the Super Timing patterns. I will often combine natal charts from major highs and lows over many years to get the right picture that will also blend in with the current transits. This tips me off when to expect bigger reversals than normal.

Jupiter Ingress and Soybeans

There are many different types of fixed cycles one of these is when Jupiter is at 90, 180, 270 and 360 degrees. These degrees are the ingress points that lie on the cardinal cross. The following charts show some examples of Soybeans over the years since 1951.

A simple entry method would be a moving average cross over or a trend line break. I have marked the first two charts in the series with a trend line so that you can get an idea of what I mean.

Day Trading the S+P with Astrological Aspects

Aspects occur during and out of market hours. To use an overnight aspect, add either twelve or six hours to bring the time into market hours.

An aspect timed for two minutes to eleven on Thursday night is used the next day at two minutes to eleven on Friday morning. An aspect at twenty past six Friday morning is used by adding six hours and bringing it up to twenty past twelve Friday afternoon.

The charts that follow are from one week in March 2001. I have used an aspectarian to give me the exact times based on these charts which have New York time even though the pit is in Chicago.

MARCH 2001												Aspectarian - EST

Only the aspect at 12.10 took place during market hours the rest were exactly six or twelve hours before.

The 1.08 aspect was the only one during market hours all the other times were echoes from six or twelve hours previous.

Summary of the Fixed Cycles used in Part One

U.S. Bonds - Venus Heliocentric 56, 176, 296 degrees

U.S. Bonds - Mercury conjunct, square or opposite Jupiter

S+P -Heliocentric Venus 120 degrees or conjunct Uranus

S+P - Venus and Mars separated in steps of 30 degrees

Wheat weekly charts – Sun conjunct Saturn

Soybeans weekly charts - heliocentric Venus 120 degrees or conjunct Jupiter

Venus or Mars ingress - All Markets

Time by Degrees -Sun in 30 degree multiples- All Markets

Planets by Degrees - Jupiter every 15 degrees both helio and geocentric, All Markets

Summary of techniques used in Part One.

Retrograde – Direct planets – All Markets

Repeating Aspects – All Markets

Transits to Natal charts – All Markets

Chart Patterns

Pattern 3

Pattern 3

A *pattern 3*, which is a five wave triangle, is a highly reliable end pattern and occurs frequently. Wave a is by far the longest price wave. Wave a may consist of three waves or five waves.

Wave b, wave c, wave d and wave e

- will have similar price range,
- will possibly skew, and
- will show similar subdivisions.

Wave e will be very brief timewise unless wave e is in itself a smaller five wave triangle. The entry to a pattern 3 is a break of wave d.

This is a useful pattern to monitor, the following charts are examples showing both clear pattern 3 samples and also “fuzzy” examples that I personally class as a pattern 3.

Can you see the pattern 3?

Pattern 3 can be a high or a low.

There was a pattern 3 high at the beginning of the chart on the 5th and 6th as well as the low marked as it was in progress.

This was the result of the lower pattern 3 on the hourly Euro Currency Unit.

The Swiss Franc hourly chart shows two examples of pattern 3 as a low.

The second example is valid but it would be better to trade the more obvious examples until you have a lot of experience working with the pattern.

In this chart of the hourly British Pound there is a pattern 3, can you see it?

Failed Signals

The following charts demonstrate trend line breaks that work well or fail.

When a break of a trend line or a well defined support-resistance point breaks and then the market reverses back in its original direction this failed break is in it self a signal to get back on the original trend.

When the breakout price bar shows a large range this bar can be used as a stop and reverse level. If the breakout bar just drifts through the trend line it is much more risky and stops have to be under the recent congestion area.

Also the larger the time frame the more reliable the signals and profit potential. These charts haven't got every break or failure marked for clarity so you will find other valid examples on the same charts.

Dynex Corporation - Contrarian Forex Portfolio Manager

USD/CHF Daily

Organization

The purpose of good organization is to,

- a) Keep you focused.**
- b) Tell you when you are likely to trade.**
- c) Make sure you never miss a trade.**
- d) Keep you aware of your current financial position.**

Your organization is in two areas, business management and trading.

Business

- a) Keep a daily ledger showing the current state of your trading account including cash and open positions.**
- b) Graph your equity weekly.**
- c) Check your brokers statements every time you receive them.**
- e) Write down all your orders to your broker and log the time and date they were placed.**
- f) Tape all your telephone conversations with your broker in case of later disputes.**

Trading Routine

- a) Getting your price data.**
- b) Updating your time cycle data.**
- c) Reviewing your charts with your trading methods.**
- d) Writing down your trading plan which consists of**
 - 1. entry 2. exit 3. stop levels.**
- e) print price charts of your trades marking entry and exit, note why you traded.**

On the following pages I have reproduced part of a trading routine that you could modify to suit your situation. A good idea is to laminate a print out of your routine and keep it at your desk for reference as you work.

The second page which is a list of your markets can be printed fresh each day so that you can add your notes on current cycles, price levels for entry, exit and stops. It is a simple tool but it certainly helps clarify your mind and allow you to focus on your trading.

What is Realistic

I will assume that most traders enter the markets to make money rather than the other possible reasons of a more psychological nature

Traders tend to focus on entry and exit methods rather than risk reward, also they tend to over estimate the amount of money they can earn from the amount of capital that they have available.

How many points do you need to make \$ 500

Emini	10
Currencies	40
Grains	10 cents
Gold	5 dollars
Bonds	16
Stocks	5
OEX options	5

How many points do you need to make \$ 1000

Emini	20
Currencies	80
Grains	20 cents
Gold	10 dollars
Bonds	32
Stocks	10
OEX options	10

How many points do you need to make \$ 5000

Emini	100
Currencies	400
Grains	100 cents
Gold	50 dollars
Bonds	160
Stocks	50
OEX options	50

How many points do you need to make \$ 10000

Emini	200
Currencies	800
Grains	200 cents
Gold	100 dollars
Bonds	320
Stocks	100
OEX options	100

How many points do you need to make \$ 100000

Emini	2000
Currencies	8000
Grains	2000 cents
Gold	1000 dollars
Bonds	3200
Stocks	1000
OEX options	1000

All of the above calculations take no account of business overhead such as

Commissions

Losing trades

Data feeds

Telephone

Computers

Rent

Taxes

On the next charts I've marked the sort of moves possible in the markets so you can compare them with the number of points you need to make for different monetary goals.

Two immediate conclusions can be drawn from this, don't leave your day job until you have plenty of trading experience and you will need to eventually trade multiple contracts to make any kind of decent living.

A Glossary of Astrological Terms

Air: One of the four Elements. (Fire, Earth, Air, Water)

Applying: When the distance between two Planets in aspect is narrowing towards an exact aspect, the aspect is said to be an applying aspect. An orb of 179 degrees would be moving toward [applying aspect] the exact aspect value of 180 degrees and an orb of 182 degrees would be moving away from [separating aspect] the exact orb of 180 degrees.

Ascendant: Follow the horizontal line on the natal chart wheel to the left where it intersects with the wheel. The Zodiacal Sign located here on the Cusp of the first House is the Rising Sign, and this sign and its number of degrees are called the Ascendant. It represents your way of expressing yourself in action. This is one of the four main horoscope angles of the chart wheel, which are considered sensitive points. These four angles are located at the very leftmost point (Ascendant), the very rightmost point (Descendant), the top (Midheaven or MC), and the bottom (Nadir or IC [Imum Coli]) of the chart wheel.

Aspect Configurations: Patterns of aspected Planets, such as a Stellium, Grand Trine, Grand Cross, T-Square, or Yod. These patterns point to major issues, talents, and challenges within one's nature.

Aspect: The angular separation between two bodies, measured along a great circle, is termed Aspect. Each one of a set of specific number of degrees has an Astrological name and symbol and describes a way in which the energies of the two bodies influence each other. In additions, certain groups of aspects have specific names eg Stellium, Grand Trine, Grand Cross, T-Square, Yod, etc

Asteroids: The effects of the Asteroids have been studied, much as the effects of the Planets, and they may well be the remains of an exploded planet. Ceres, Pallas, Juno, and Vesta were the first four asteroids discovered, but there are hundreds.

Astrological Chart: Any chart calculated for a specific time and place. A Natal chart is calculated for the time and place of a person's birth: A Transit chart calculates the position of the Planets at a specific time and place (such as an specific event). A Progressed chart calculates the position of the Planets at specific time and place and places these "progressed" positions of the Planets within the Natal chart. This gives valuable information on how the present positions of the Planets are affecting any person's unique natural patterns.

Astrological Sign: There are 12 Signs of the Zodiac.

Benefics: An old term applied to the Planets Sun, Venus, and Jupiter by traditional Predictive Astrology; thought to bring "good luck".

Birth Data: The personal information required to calculate a Natal chart; the year, month, day, exact time, and geographical location of a person's birth.

Cardinal: The four basic Elements (Fire, Earth, Air, and Water) can each act in one of three basic ways, or Modes, Cardinal, Fixed, or Mutable.

Chart Ruler: The Planet that rules the Sign on the Ascendant of your Natal chart is called the Chart Ruler and its placement in your chart strongly affects all other parts of the chart.

Chiron: A minor Planet discovered in 1977, Chiron is located between the orbits of Saturn and Uranus. It appears to be associated with expanding consciousness and powers of healing and properties like the Moon.

Daily Motion: Each Planet moves at a different speed through the sky and each has an average amount of movement per day.

Descendant: The point in a natal chart opposite to the Ascendant.

Declination: The number of degrees a body is North or South of the Equator is its declination. Parallels are aspects in declination, and the effect is considered to be similar to a conjunction.

Detriment: (see below, Dignity:)

Dignity: A Planet's dignity basically refers to the strength of its position in the chart. A Planet is strong, or said to be Dignified, when in a sign that it rules it is said to be exalted when in specific signs, or to be in its fall or detriment when in other certain signs.

Elements: Fire, Earth, Air, Water.

Fixed: The four basic Elements (Fire, Earth, Air, and Water) can each act in one of three basic ways or Modes, Cardinal, Fixed, or Mutable.

Geographical Coordinates: The geographical coordinates, the longitude and latitude of a geographical location, are necessary to construct a chart and may be found in an Atlas.

Geocentric Planets: As seen from the center of the planet.

Glyph: An astrological symbol. Throughout this booklet you will see the glyphs for the signs of the Zodiac, for the Planets, and for aspects.

Grand Cross: An aspect configuration in which four planets form four squares and two oppositions in the chart. This configuration shows inner power and strength, and where and what will intensely challenge them to be developed.

Grand Trine: An aspect configuration in which three planets are trine each other, usually in the same element.

This configuration indicates an easy energy, "good luck" without effort. If no other aspect challenges here, there may be an inclination to move on one's charm or luck rather than to develop inner potentials.

Heliocentric Planets: As seen from the center of the Sun.

Horoscope Angles: There are four main horoscope angles in the chart wheel, which are considered sensitive points. These four angles are located at the very leftmost point (Ascendant), the very rightmost point (Descendant), the top (Midheaven or MC), and the bottom (Nadir or IC [Imum Coli]) of the chart wheel.

House System: The band of sky in which the Planets move is called the Zodiac. The Zodiac is divided into 12 signs, each of which contains 30 degrees (1/12th of a circle). Each sign represents a specific energy pattern and has a corresponding House. The House represents the field of experience, the arena, in which the energy pattern of the Sign acts in your life. Each House has a Planet which is its natural ruler and your Natal chart will have your own planet that rules each sign.

There are at least fourteen methods of calculating houses. The methods are named after the inventors of the system. Some of the most used house systems are; Koch, Campanus, Placidus, Equal, Porphyry and Eridan.

IC: See Nadir:

Kite: An aspect configuration where a Planet opposes one of the Planets in a Grand Trine. This opposing Planet can supply the challenge and the channel for the Grand Trine energies.

Malifics: Old time predictive astrology considered Mars and Saturn to be bad luck. If you do not work with the insistent energy of these Planets, the friction caused by your resistance can be felt in your life as pain, bad luck, etc., but it's as much the lack of awareness that causes the problem as it is the energy pattern itself.

Midheaven (MC): One of the four mundane points in the chart, the midheaven is located at the highest point overhead; the cusp of the 10th house.

Mutable: The four basic Elements (Fire, Earth, Air, and Water) can each act in one of three basic ways, or Modes, Cardinal, Fixed, or Mutable.

Mutual Reception: When each of two Planets is in the Sign ruled by the other, a relationship is formed that acts much like a conjunction. (example; The sun [ruled by Leo] is in Cancer and the Moon [ruled by Cancer] is in Leo.)

Nadir (IC or Imum Coli): Cusp of the 4th house. This is one of the horoscope angles. The IC is thought to be a transformation point in the chart.

Natal Chart: An Astrological chart calculated for the time, date, and geographical location of a specific person.

Native: A term sometimes used by astrologers to refer to the person for whom a reading is being given.

Node: The location of the nodes can be calculated for each planet, but in practice the term usually refers to the North and South nodes of the Moon. The Location of the nodes of the moon give information about our life's work. The North Node represents the ideals toward which we are moving, and the South node represents the gifts we bring from the past; the things that we already know how to do well.

Orb: The number of degrees from exact allowed for an aspect.

Part of Fortune: A calculated point in space said to indicate, by House placement, where a person's talents lie.

Planet Positions: The Sign and House position of a Planet within an astrological chart.

Progression: The Natal horoscope reveals the energy patterns imprinted on us at the time of birth. There are several methods by which the planetary positions are moved (progressed) forward (or backward) in time, and their energy patterns can be seen to activate Natal patterns. This Technique shows inner growth potentials.

PRIMARY PROGRESSION: One degree is added to the natal Planet's position for each year of real time.

SECONDARY PROGRESSION: One day's planetary movement equals one year of real time.

Quadrant: The circle of the 360 degree chart is divided into four quadrants. Each quadrant represents an arena of experience. First equals intuition, second equals emotion or feelings, third equals sensation and fourth equals thinking.

Relocation: The computation of a chart for a given time, using a different (relocated) longitude and latitude. (For example: if one lives in a different place than the birthplace.)

Retrograde Planets: When a Planet appears to move backward as seen from the earth it is said to be retrograde. This will be marked on a Natal Chart, for example, by a R after the Planet, sign, and degrees notation. The energy patterns of a retrograde Planet tend to be experienced more on an internal level than those experienced by direct movement.

Ruler: Each Sign of the Zodiac and each of the 12 Houses are associated with a specific Planetary energy, and is said to be ruled by that Planet. The Planet that rules the sign on the Ascendant is called the Chart Ruler.

Separating: When the distance between two Planets in aspect is widening away from the exact, it is said to be a separating aspect.

Sidereal Zodiac: The measuring system in which a Planet is measured in relationship to a background of fixed stars.

Solar Arc: An angular distance between the Natal Sun and the secondary progressed Sun that is used for a technique called solar arc directions.

Stellium: An aspect configuration where at least 4 planets are located within 8 degrees of the next Planet, and in the same Sign, indicating a strong area of focus in the chart.

Synastry: The art of chart comparison between 2 people in order to understand relationships.

Transiting Planets: Transits refer to the current position of the planets. These positions relative to the Natal placement of Planets give information about what energy patterns in the Natal Chart are now being activated.

T-Square: A configuration of Planets in aspect; two opposing Planets are square a third Planet. All are usually in the same mode. This configuration indicates a high degree of motivation and ability to achieve, and a difficulty staying balanced. The focal point of the aspect holds the key to what issues are involved.

Tropical Zodiac: The measuring system in which planetary longitudes are measured against the point in the sky where the Sun is on the first day of Spring. This is the system most used in Western Astrology.

Uranian Astrology: A system of Astrology that uses sensitive points in the chart to understand the horoscope. In addition to the traditional sensitive points (Sun, Moon, Planets, Ascendant, Moon's Nodes), this system also uses the Transneptunian Planets, midpoints, and a 90 degree wheel. The Transneptunian Planets are; Cupido, Hades, Zeus, Kronos, Appollon, Vulcanus, and Poseidon. This system appears to be particularly effective in Medical Astrology.

Vertex: An experimental horoscope angle, or sensitive point. As the horizon divides the chart into up and down, the vertex divides it into back and front.

Zodiac: The band of sky in which the Planets move is called the Zodiac. The Zodiac is divided into 12 signs, each of which contains 30 degrees (1/12th of a circle). There are two Zodiac systems, the Tropical Zodiac and the Sidereal Zodiac.

Tropical Zodiac: The measuring system in which planetary longitudes are measured against the point in the sky where the Sun is on the first day of Spring.

Sidereal Zodiac: The measuring system in which a Planet is measured in relationship to a background of fixed stars.

Futures and Options Glossary

Commonly Used Terms

ABANDON: The act of not exercising or selling an option before its expiration.

ADVANCE/DECLINE LINE: The total of the difference (daily) between the number of advancing and declining stocks.

ACTUALS : The actual commodity, not the futures contract.

ARBITRAGE: The simultaneous purchase of one commodity against the sale of another with the hope of profiting from distortions in normal price relationships.

ASSIGNMENT: The receipt of an exercise notice by an option writer (seller) that obligates him to sell (in the case of a call) or to purchase (in the case of a put) the underlying security at the specified strike price.

AT THE MARKET: Orders which are to be executed immediately by the floor broker at the best possible price.

AT THE MONEY: An option is at the money if the strike price of the option is equal to the market price of the underlying commodity.

BACK TESTING: Refining a system on historical data and applying it to new data to see how well the strategy works.

BASIS: Point difference over or under a designated future at which a cash commodity is sold or quoted.

BEAR: One who believes prices will decline.

BEAR MARKET: A market characterized by declining prices. Generally considered to be a 20% decline.

BEAR TRAP: A false signal which would make one believe that the upward trend of a stock or commodity has reversed , when in fact it has not.

BID: An offer to buy a commodity that is subject to immediate acceptance.

BOLLINGER BANDS: Trading bands above and below a simple moving average. The standard deviation of closing prices for a period equal to the moving average employed is used to determine the band width. This causes the bands to tighten in quiet markets and loosen in volatile markets. The bands can be used to determine overbought and oversold levels, locate reversal areas, project targets for market moves, and determine appropriate stop levels.

BULL TRAP: A false signal which would make one believe that the downward trend of a stock or commodity has reversed , when in fact it has not.

BUYING HEDGE: Going long positions equal to the amount of the cash commodity which will eventually be needed for production.

BUY ON CLOSE: To buy at the end of a trading session at a price within the closing range.

BUY ON OPENING: To buy at the beginning of a trading session at a price within the opening range.

CALL: An option contract giving the owner the right, but not the obligation, to buy a specified amount of an underlying commodity at a specified price within a set timeframe.

CARRYING CHARGE: The cost to store and insure a physical commodity.

CFTC: The Commodity Futures Trading Commission.

CLOSE: The time at the end of the trading session when all orders are filled within the closing range.

CLOSING RANGE: The range of prices in which transactions take place at the closing of the market. Buy and sell orders at the close should have been filled at any point within this range.

CONTRACT: In futures markets, a standardized traded instrument that specifies the quantity and quality of a commodity (or financial asset) for delivery (or cash settlement) at a specified future date.

CONTRARIAN: One who trades on contrary opinion.

CONTRARY OPINION: The view that one can profit by doing the exact opposite of the majority of traders.

COVER: To sell futures contracts in order to offset previous buying.

COVERED CALL OPTION WRITING: A strategy in which one sells call options while at the same time owning an equivalent position in the underlying commodity. Also, a strategy in which one sells put options while at the same time is short an equivalent position in the underlying commodity.

DAILY RANGE: The difference between the high and low during one trading day.

DAY ORDER: An order that expires on the close of trading if not filled during that day.

DAY TRADE: A trade that is liquidated on the same day that it is initiated.

DELIVERY NOTICE: A notice of intention to deliver a stated quantity of a commodity in settlement of a futures contract.

DELTA: The amount an option will change in price for a one point move in the underlying commodity.

DISCOUNT: When a future is trading for less than the price of the underlying commodity, it is considered to be trading at a discount.

DIVERGENCE: The failure of a market or of an indicator to follow suit when a related market or indicator sets a new high or low. Divergences can sometimes signal market tops and bottoms.

DIVERSIFICATION: Trading multiple markets in an effort to reduce one's risk.

DOWNTREND: Declining prices in any given market.

DRAWDOWN: Equity reduction in a trading account. The maximum drawdown is the largest difference between an equity's peak and its low.

EQUITY: The dollar value of an account.

EXPIRATION DATE: The date on which an option and the right to exercise it, cease to exist.

FADE: Trading the opposite direction of a market signal.

FALSE BREAKOUT: A short lived price movement that goes through the previous high, only to fall significantly.

FILL OR KILL: An order that must be filled immediately or canceled.

FIRST NOTICE DAY (FND): The first day on which notice of intentions to deliver actual commodities against futures contracts can be made.

FLOOR BROKER: A member who executes orders for the accounts of other members on the trading floor.

FLOOR TRADER: A member of an exchange who trades on the floor for personal gain. Usually called a "local."

GAP: A price zone in which no trades have occurred.

GOOD TILL CANCELED ORDER (GTC): An open order that remains in force until the trader either cancels the order, the futures contract expires, or the order is filled.

IMPLIED VOLATILITY: The expectation of future price volatility implied by option prices.

INSIDE DAY: A day in which the total range of price is within the range of the previous days price range.

IN THE MONEY: A call option is “in the money” if the strike price is less than the market price of the underlying commodity. A put option is “in the money” if the strike price is greater than the market price of the underlying commodity.

INTRINSIC VALUE: The amount by which an option is in the money.

ISLAND REVERSAL: A trading range where there is an exhaustion gap down, then prices move in a narrow range, then there is a breakaway gap up. This leaves a sort of island of prices in the middle.

LAST TRADING DAY (LTD): The final day in which trading may occur for a particular delivery month. After the last trading day, any remaining commitment must be settled for delivery.

LEVERAGE: The ability to control a dollar amount of a commodity in excess of the actual capital employed.

LIMIT ORDER: An order in which the trader sets a limit to the price, as contrasted with a market order on which no limit is set.

LIMIT PRICE MOVE: The maximum amount that a particular market can move in a single day.

LIQUIDATION: The closing out of a previous position by taking an opposite position in the same contract.

LIQUIDITY: The degree to which a given market is liquid. A market with a larger number of trades is called a liquid market, and this makes entering and exiting this market easier for a trader.

LOCAL: A floor trader who trades for his or her own account.

LONG: A position established by buying a futures contract. The holder of this position may also be referred to as a “long”.

LOT: Another term for contract.

MARGIN: The amount of capital required to trade a futures contract.

MARGIN CALL: A demand by a broker for additional funds sufficient to raise your deposit on a commodity futures contract above the minimum acceptable level.

MARKET IF TOUCHED (MIT): An order that may be executed only if the trigger price is reached.

MARKET ORDER: An order that is to be filled as soon as possible at the best possible price.

MARKET NOT HELD ORDER: This is a market order. However, the speculator is giving the floor trader the discretion to execute the order when he/she feels it is most profitable. If the floor trader feels that the market will decline, he/she may hold the order to try to get a better fill. There are no guarantees that this order will be filled.

MONEY MANAGEMENT: Risk control commonly used to cut losses and maintain equity.

MOVING AVERAGE: A method of smoothing prices to more easily discern market trends, within a fixed number of days.

MOVING AVERAGE CONVERGENCE/DIVERGENCE (MACD): The crossing of two exponentially smoothed moving averages. They oscillate above and below an equilibrium line.

NAKED OPTION: A short option held by a trader who does not own the underlying commodity.

NEARBY: The nearest active trading month of a futures or options on a futures contract. Also known as the lead month.

OFFER: The price at which an investor is willing to sell a futures or options contract. As opposed to a bid.

OPEN INTEREST: The total number of futures contracts entered into during a specified period of time. When a contract month first begins trading, the open interest is zero. An indicator of the depth or liquidity of a market (the ability to buy or sell at or near a given price).

OPENING RANGE: Range of closely related prices at which transactions took place at the opening of the market. Buy and sell orders at the opening might be filled at any point within such a range.

OPEN ORDER: An order given to a broker that is good until canceled or executed.

OUT OF THE MONEY: A call option is out of the money if the strike price is greater than the market price of the underlying commodity. A put option is out of the money if the strike price is less than the market price of the underlying commodity.

PREMIUM: The price a speculator pays the writer of an option above the option's intrinsic value.

PRICE LIMIT: The maximum price advance or decline from the previous day's settlement price permitted for a commodity in one trading session by the rules of the exchange.

PUT: An option contract that gives the holder the right to sell the underlying security at a specified price for a fixed period of time.

PUT/CALL RATIO: The amount of put options divided by the amount of call options.

PYRAMIDING: The practice of using accrued paper profits to margin additional Trades.

RANGE: The difference between the highest and lowest prices recorded during a given trading session, week, month, or year.

REACTION: A price movement in the opposite direction of the trend.

RESISTANCE: The price at which a rising market is expected to encounter increased selling pressure sufficient to reverse an advance.

RETRACEMENT: A price movement counter to a preceding trend.

REVERSAL DAY: A day on which a market reaches a new high and then reverses direction, closing below one or more previous daily closes.

RISK/REWARD RATIO: The ratio of the estimated potential loss in relation to the potential gain.

SETTLEMENT PRICE: The price at which the clearing house clears all transactions at the close of the day. Settlement prices are used to determine gains, losses, margin calls, and invoice prices for deliveries.

SHORT: A trader who has sold futures, speculating that prices will decline.

SHORT HEDGE: The sale of a futures contract in anticipation of a later cash market sale. Commonly used to lessen the possible decline in value of ownership of an approximately equal amount of a physical commodity.

SLIPPAGE: The difference between the theoretical execution price and the actual fill.

SPECULATION: Buying or selling in hopes of making a profit.

SPECULATOR: One who trades a commodity with a higher than average risk in return for a higher than average profit potential.

SPIKE: A price that is sharply above (or below) the preceding day's price.

SPOT DELIVERY MONTH: The nearest delivery month among all those traded at any point in time. The actual contract month represented by the spot delivery month is constantly changing throughout the calendar year as each contract month reaches its last trading day.

SPOT PRICE: Cash price.

SPREAD: The purchase of one futures contract or option and sale of another, in the expectation that the price relationships between the two will change so that a subsequent offsetting sale and purchase will yield a net profit.

STOP AND REVERSE: A stop that when hit, is a signal to close the current position and open an opposite position. One holding a short position would buy that position and then go long on the same commodity.

STOP ORDER: A buy order placed above the market (or sell order placed below the market) that becomes a market order when the specified price is reached.

STOP LIMIT ORDER: Much the same as a stop order. It is an order which becomes a limit order once the target price is touched.

STRADDLE: An options strategy where the purchase or sale of an equal number of puts and calls is made. The strike price and expiration date is the same for all.

STRANGLE: An options strategy which combines a put and a call, with different strike prices with the same expiration.

STRIKE PRICE: The price for which the underlying commodity may be purchased in the case of a call, or sold in the case of a put, by the option holder upon exercise of the option contract.

SUPPORT: A barrier to a price decline. A point at which a falling market is expected to encounter increased buying pressure sufficient to reverse the decline.

TICK: The minimum possible price movement in a market.

TOPPING OUT: A term employed to denote loss of upside energy at the top after a long price run-up.

TRADING RANGE: A sideways price band that encompasses all price movements during a specified period.

TREND: The tendency of markets to move in a general direction, either up or down.

TRENDING MARKET: Price moves in one direction and it usually closes on an extreme for the day.

TRENDLINE: Normally drawn by connecting a series of descending peaks or ascending troughs. The more times a trendline has been hit increases the significance of a break in the trendline. It can be either support or resistance.

UPTREND: A tendency for rising prices in a market.

VEGA: The measurement of how much an option's price changes for a 1% change in volatility.

VERTICAL SPREAD: An options strategy which is also a spread where the options have different strike prices but the same expiration dates.

VOLATILITY: Price variability in a given market. A volatile market is one in which there are wide price fluctuations.

VOLUME: The number of purchases and sales of a commodity made during a specified period.

WHIPSAW: Repeated, abrupt reversals in a trend.

Books by Myles Wilson Walker

C Wave Method –How To Identify High Profit Elliott Waves in Real Time (1996)

Super Timing – W.D. Ganns Astrological Formula for Stocks and Futures (1999)

Super Timing Volume Two – Bonus CD included with each copy of Super Timing (2000)

The Book Of Eclipses – Limited Edition (2000)

SUPER TIMING

W.D. Ganns Astrological Formula for Stocks and Futures.

In SUPER TIMING this formula is shown in detail. All of Ganns public predictions were analysed to reveal the one common factor.

Supertiming explains all of Ganns predictions by using the one formula.

It shows you which planet will be signaling the next trend turn and it works on all markets.

As well as Ganns timing method there is the price target method which is demonstrated by his predictions and from real life examples in recent markets (this is not a planets longitude converted to price)

There are still many people who think that W.D. Gann used only swing charts, angles or fixed time periods.

None of these can be used to consistently explain all his public predictions.

The real answer is in Super Timing where you will learn the pattern combination that is found in all of Ganns predictions both long and short term. You will see how this works on a swing basis as we work through whole sequences of short term trades that Gann actually did. Nothing has been omitted

You will see why he entered the market when he did and the reason he took profits only to re enter at a better price the next day.

The markets covered are coffee soybeans and cotton but the same method works on any market and more importantly it is still working today.

When you take the time to study Super Timing you will prove to yourself that this really is the best timing method available.

The method is actually quite easy to learn as there is no complex Astrology (it is based only on the positions of the planets as seen from earth and their angular relationships)

I have a freeware program for you that will do all the calculations

There is also Ganns price target system that solves the price part of the formula.

Super Timing

Table of contents:

Introduction.

W.D.Gann and Astro-The proof.

Ganns first trade on August 15th 1902.

The W.D.Gann Astrological method solves the following trades.

Wheat September 30th 1909.

Cotton high 1923.

Cotton low 1953.

Cotton top in 1952 and the low in 1953.

Comparison of the Coffee low in 1953 and the high in 1954.

Coffee high 1954.

Soybean high September 14th 1941.

Soybean low October 17th 1941.

Soybeans sold November 14th 1941.

Soybean high November 23rd 1948.

Soybeans sold April 27th 1954.

Cotton high 30th November 1923.

Gann finished cotton trades and closed.

Soybeans sold April 27th 1954.

Soybeans buy/close May 5th 1954.

Soybeans sold again May 7th 1954.

W.D.Ganns scientific forecasts.

The Morning Telegraph artical on Gann December 17th 1922.

Dow Low August 24th 1921.

Dow top August 14th 1922.

Dow top October 8-15th 1922.

Panicky decline November 10th -14th 1922.

Summary of Ganns Sequence of stock market predictions September 3rd 1929 to July 21st 1933.

Top September 3rd 1929.

Low October 3rd 1931.

Low February 10th 1932.

Low February 10th 1932.

High March 8th 1932.

Low July 8th 1932.

High September 20-21st 1932.

Low October 4-5th 1932.

Low March 1st 1933.

High July 17th 1933.

Low July 21st 1933.

Price and planetary activity at the same point.

Complete Coffee trades 1954.

Coffee high 1954.

Coffee buy/close April 14th 1954.

Coffee sold again April 15th 1954.

Coffee trades finish April 21th 1954.

**Examples of the price target method from recent markets. Currencies,
grains crude oil.**

Ganns trading strategy.

Robert Gordons great campaign in cotton.

**The Super Timing tutor that shows the beginning and end of the
major U.S. bullmarkets and how each ending is predicted by the beginning astro.**

**Planetary cycles for Soybeans, Wheat, Corn, Currencies, Crude Oil, S+P, Dow,
Nasdaq, U.S. Bonds.**

Plus how to find the Dynamic cycles for any stock or commodity.

The Super Timing Annual Forecast

**Included with each book is a bonus CD - SUPER TIMING VOLUME TWO
200+ pages with lots more information about W.D. Ganns methods**
