Dow Does The Tango

What's Controlling The Market?

When the movement of the Dow Jones Industrial Average and Fibonacci levels are in line, what's it telling you? Let's take a look at the Dow's history and see if its movements are truly random.

the talk about artificial intelligence (AI) today is so pervasive that it's worth asking the question, "Can an AI footprint be found in the market?" By "AI," I don't mean computer-coded algorithms but rather a natural order that can be seen as patterns in the market. Let's explore this idea by examining the history of the Dow Jones Industrial Average (DJIA) between the years 1896 and 2007 using daily DJIA theoretical highs and lows as found in the DJIA historical database. (The DJIA theoretical high or low is calculated as if all the component stocks hit their highs or lows simultaneously during the day).

A NON-RANDOM WALK DOWN WALL STREET

The DJIA was conceived on May 26, 1896 at 40.94. It took off and was never lower as it advanced to a peak in 1929 at 386.1. It then crashed back to 40.56 on July 8, 1932. Then it rallied over 75 years to the October 2007 peak at 14,280. Why is this important?

If you take the log of these historical price points (see Figure 1) you get almost precisely some power of the Fibonacci ratio, 1.618 (actually it's 0.01 shy). Two price points are at 1.608, one price point is at 1.608², and one price point is at 1.608³. The DJIA, in terms of Fibonacci, took one step forward, one step back, and then two steps forward, all in the space of 111 years. This looks like a Fibonacci dance step!

The DJIA appears to be tuned to Fibonacci, dancing to one of nature's natural melodies. It is fascinating how there is a precise mathematical relationship between the 1929 top, the 1932 bottom, the 2007 top,

and the very first day of the DJIA's existence, and it is all related to the Fibonacci ratio. This is no random walk! One could speculate the market is following a script. Is an algorithm controlling the market? Let's explore the market action from the 1932 bottom to the 2007 top using Elliott wave analysis to find out.

A MATHEMATICAL STEP DOWN WALL STREET

Figure 2 shows the chart of the DJIA in the timeframe

FIGURE 1: FIBONACCI RELATIONSHIPS BETWEEN MAJOR PRICE POINTS IN THE HISTORY OF THE DJIA. The DJIA in terms of Fibonacci took one step forward, one step back, and then two steps forward, all in the space of 111 years.

FIGURE 2: FIVE WAVES OF CYCLE DEGREE. This is a completed pattern consisting of five waves up of Cycle degree.

by Eric Morgan

FIGURE 3: THE BIG PICTURE. Can you find the mathematical relationship?

FIGURE 4: CYCLE I SUBDIVIDED INTO FIVE PRIMARY WAVES

FIGURE 5: CYCLE III SUBDIVIDED INTO FIVE PRIMARY WAVES

FIGURE 6: CYCLE V SUBDIVIDED INTO FIVE PRIMARY WAVES

of interest with wave labeling added. This is a completed pattern consisting of five waves up of Cycle degree. Let's decompose Cycle I, III, and V.

Figure 3 shows the idealized version of Figure 2 at Cycle degree with each cycle replaced by a straight line. Notice the mathematical relationship between Cycle I, III, and V. If you divide the peak of Cycle I by its starting point you get $195.59/40.56 = 4.82$. For Cycle III you get $1,001.11/92.69 = 10.8 = 4.82 * 2.24$, and for Cycle V you get $14,280/570 = 25.05 = 4.82 * 2.28^2$.

Notice that the mathematical relationship between Cycle I, III, and V is based on the magnitude of Cycle I and the factor between the price level at the beginning of Cycle I and the end of Cycle II (2.28). The price relationship between Cycle V and Cycle I is mathematically perfect. Cycle III would be mathematically perfect if the peak of Cycle III was 1,015 instead of 1,001: $1,015/92.69 = 10.98 = 4.82 * 2.28$. If it weren't for a measly 14 points, then Cycle I, III, and V would be perfectly related. Think of all the thousands of points the DJIA has traversed in that 75-year expanse and it missed mathematical perfection by just 14 points characterized by two parameters. The Cycle III orthodox top was 1,001, but the market spent several years going above and below 1,000 until 1973. The Cycle III top was the only top or bottom that wasn't a clean spike.

In reality, perhaps it only takes one parameter to explain 75 years of DJIA history, because $4.82 = 1.205 * 4$, $2.11 = 1.205^4$, $1.756 = 1.206^3$, and $2.28 = 1.205^{4.42}$ where $4.42 = 1.204^8$. So every parameter in this Elliott structure can be derived from one constant (1.205). Simply amazing!

NEXT LEVEL DOWN

Going one level lower, let's subdivide Cycle I, III, and V into their five primary wave components (see Figures 4, 5, and 6). The start of each cycle to the primary wave 3 top was very close to some power of 2.76. The power was 1, 2, and 3, in that order. Cycle III was just shy at 2.72. Cycle I equals $111.93/40.56 = 2.76$. Cycle III equals $688.21/92.69 = 7.424 = 2.724^2$. Cycle V equals $11908/570 = 20.89 = 2.754^3$.

Now let's compare the top of wave 3 to the top of wave 5. For Cycle I, $195.59/111.93 = 1.747 = 1.204^3$. For Cycle III, $1,001.11/688.21 = 1.454 = 1.206^2$. For Cycle V, $14,280/11,908 = 1.199$. Here, the relationship between the top of wave 3 and the top of wave 5 is some power of 1.20. The power in this case is in descending order: 3, 2, 1. Now let's compare the top of wave 3 to the bottom of Cycle II and Cycle IV. For Cycle I, the top of wave 3 divided by the bottom of Cycle II is $111.93/92.69 = 1.207$. For Cycle III, the result is $688.21/570 = 1.207$ again.

There is also a relationship between down waves within the cycle and the next larger-degree down wave. For Cycle I, multiply Primary wave 2's magnitude with Primary wave 4's magnitude and compare that to Cycle II. $1.638 * 1.305 = 2.138$. Cycle II = 2.11. Doing the same for Cycle III, the result is $1.328 * 1.312 = 1.742$. Cycle IV was 1.756. Note that 2.11 is 1.205^4 , and 1.756 is 1.206^3 . The 1.20 factor is ubiquitous in these primary wave relationships as it was in the cycle degree relationships seen earlier. The consistency of these relationships across Cycle I,

FIGURE 7: PRIMARY WAVE 3 OF CYCLE III. Here you see the linear and logarithmic relationships.

FIGURE 8: TRIANGLE METHODOLOGY OF CYCLE I AND CYCLE II

FIGURE 9: TRIANGLE METHODOLOGY OF CYCLE III AND CYCLE IV

FIGURE 10: THE LARGER FRACTAL. The perfect Dow fractal seems to be embedded in a larger fractal.

These repeatable mathematical relationships bring a beautiful order and understanding to the seeming chaos of the market.

III, and V is amazing. Is an algorithm at work here?

Let's look at one more wave structure, primary wave 3 of Cycle III. This wave subdivided as shown in Figure 7. First, notice the length of Intermediate wave 3 and wave 5 are practically identical, and wave 1 is almost exactly 1/2 of wave 3 and wave 5. These are near-perfect relationships. Also, if you divide the top of waves 1, 3, and 5 by 229, you get $295.06/229 = 1.29$, $524.37/229 = 2.29$, and $688.21/229 = 3.00$. The wave 3 peak is related to wave 5 by the ratio 2.29 to 3.00, which is the same relationship between Cycle I's peak and Cycle III's peak. Cycle I = 195.59 and Cycle III = 1,001.11. The log of 195.59 = 2.29. The log of 1001.11 = 3.00. So a linear relationship at intermediate degree expressed itself as a logarithmic relationship at cycle degree. This 75-year fractal pattern has a treasure trove of mathematical relationships.

A CYCLE LENGTH PREDICTOR?

Another property of this fractal was revealed as an offshoot of my investigation of Heron's rule, which allows you to calculate the area of a triangle by knowing the length of the three sides. I formed a triangle by using Cycle I and Cycle II as two sides and formed the third side by connecting the Cycle II low back to the start of Cycle I (see Figure 8).

If you multiply the three sides of the triangle in Figure 8 and take the square root, the result is 911.92. This is only three points more than the length of Cycle III, which is 908.42. If you do the same thing for Cycle III as shown in Figure 9 and multiply the three sides of the triangle and take the square root, the result is 13,672.17. The length of Cycle V was 13,710, a difference of only 34 points. Is this mere happenstance? Wouldn't it be remarkable if there were parameters of two just-completed cycles that could be used to predict the next up cycle length? Well, this technique did just that. This is another remarkable feature of what I call the perfect Dow fractal.

THE PERFECT DOW FRACTAL (PDF)

The consistency of these mathematical relationships between waves I, III, and V is astounding. It's as if the market is following a script. Robert Prechter, an authority on the Elliott wave theory, once said, "The market has memory. It knows

Caution Ahead

The Kondratieff Wave Revisited

Given the recent market volatility, is the decade-long bull market over? And if we did enter a bear market, in what year might the market bottom and a new bull market begin? Here's a market outlook based on an updated look at K-waves and Elliott waves.

by Koos van der Merwe

my article “What To Expect In 2018” published last February in the 2018 Bonus Issue of *Technical Analysis of STOCKS & COMMODITIES* magazine, I concluded after studying Elliott wave and the Kondratieff wave that a correction should occur sometime in the year 2018. I stated that the year would be an

interesting year—a year to be cautious and a year to watch carefully. With the present correction in the market, my forecast was accurate. How did I arrive at this conclusion? I studied the Kondratieff wave, tying it to the Elliott wave to obtain a better time prediction. What do these cycles say now?

KONDRATIEFF WAVES

Nikolai Kondratieff (Kondratiev) was a Russian economist. He was the first to suggest that industrial economies followed a cycle of change in prices and production. After a great deal of study, he arrived at the conclusion that the cycle is a cycle of liquidity and not of price. He posited that rising and declining trends for money, labor, and products have an effect on the movement of a cycle.

Kondratieff brought his observations to international attention in his book *The Major Economic Cycles*, a book he wrote in 1925. The K-wave, as it is commonly known, is shown in Figure 1. He believed that the K-wave is an economic cycle that affects all sectors of the economy. He focused mainly on price and interest rates to develop his cycle theory.

Tragically, Kondratieff's research and conclusions were seen as a criticism of Josef Stalin's intentions for the Soviet economy. Because of that, Stalin had him sentenced to a Soviet gulag. He was executed in 1938.

Looking at the K-wave in Figure 1, you can see that the

Kondratieff wave predicted a correction for 2019. The chart suggests that 2019 would be a year in which panics would occur, based on the cycle of previous years with panics. Of course, not everything is that accurate, as can be seen in the chart in Figure 2, a chart that shows the K-wave superimposed on the S&P 500 index. For example, the K-wave called for a correction in 1999. The correction occurred in March 2000, the following year. It also called for a bottom in the market in 2005 but the market bottom occurred in October 2002. Note that the minor correction that was forecasted for 2016 in the K-wave chart in Figure 2 corresponding to the label “Years of good times and high value; time to sell values of all kinds” did occur as an Elliott wave 4 correction, but it occurred a year earlier, in 2015, than the K-wave forecast showed.

So although the K-wave gives us an idea of what could occur in a particular year, the timing is not always correct, especially the timing for a stock market recovery.

Because of that, I decided to tie the K-wave chart to an Elliott wave count to improve the timing of a projected correction. Looking back through history, I doubt that Ralph Elliott had ever heard of Nikolai Kondratieff and his cycle theory even though the two men lived in the same generation.

ELLIOTT WAVES

Figure 3 shows the basic Elliott wave pattern. According to Elliott wave analysis, the stock market tends to rise in five waves up and three waves down to form a complete cycle of eight waves. Waves one, three and five are known as “impulse waves,” and waves two and four as “corrective waves.” Each major wave can in turn be subdivided into impulse and corrective waves. Of course, Elliott wave counts can change as the pattern develops and events unfold.

The chart in Figure 4 is an Elliott wave count of the S&P 500 index as of December 28, 2018. It shows that the index completed a WAVE V top in October 2018, not in 2019 as suggested by the K-wave chart. However, caution prevailed, as the proximity of the Elliott wave count to the K-wave forecast did suggest caution.

Looking at the Elliott wave count in Figure 4, we can see that a Wave A bottom has occurred on October 26. We can also see that a Wave B upward correction was completed on November 7, with a Wave C correction completed on December 24. The index has since risen strongly,

FIGURE 1: KONDRATIEFF WAVE CHART. Here you see a Kondratieff wave chart going all the way back to the 1920s when Nikolai Kondratieff first wrote about it. I have projected it into the future to 2039.

FIGURE 2: THE KONDRATIEFF WAVE WITH PRESIDENTIAL CYCLES AND ELLIOTT WAVE COUNT. The K-wave was calling for a major correction to begin in 2019. A correction began in October 2018. Actual market bottoms have tended to occur two to four years before the K-wave suggests a bottom would occur. Based on that, the market could bottom between 2019 and 2021 rather than in 2023.

suggesting that the Wave C could possibly be a major WAVE A. The index has now risen in five waves in a major WAVE B with a major WAVE C correction that could bottom sometime in 2019 to 2023 as suggested by the K-wave.

TYING TOGETHER K-WAVE AND ELLIOTT WAVE

The K-wave suggests that the bottom of WAVE C should occur in the year 2023, but looking back at the chart in Figure 2, we can see that the previous WAVE C bottom occurred much earlier than that suggested by the K-wave. The previous Elliott WAVE C bottomed in March 2009, when President Barack Obama took over from President George W. Bush, rather than in the year 2012 as suggested by the K-wave. In addition, Figure 4 shows that a WAVE A bottom occurred in October 2002 and not January 2005 as suggested by the K-wave.

The reason that the dates of actual bottoming turning points in the stock market seem to have always occurred earlier than the bottom predicted by the K-wave is probably because Kondratieff was an economist and his forecast was designed to predict economic expansion, recessions, and depressions. It was not designed to predict the movement of the stock market, and certainly not the US stock market of today's modern world. At the time that Kondratieff prepared his wave theory, electronic automatic trading was an idea for a far-off future world.

So while the K-wave is suggesting a bottom in the year

FIGURE 3: BASIC ELLIOTT WAVE PATTERN. According to Elliott wave theory, the stock market rises in five waves up and three waves down to form a complete cycle of eight waves. Waves one, three and five are known as "impulse waves," and waves two and four as "corrective waves." Each major wave can in turn be subdivided into impulse and corrective waves.

2023 (Figure 1), in the past, the index bottomed two to four years before the reversal called for by the K-wave. Allowing for a similar margin of error based on how close the bottoms predicted by the K-wave have been to actual stock market bottoms, the bottom could be in 2019 and not in 2023.

Will the past success that Kondratieff had in forecasting movements of the stock market continue?

Based on the Kondratieff wave forecast, it does appear that the days of easy money could be over, and that the years 2019 to any year before 2023 will be a period of major volatility and high risk for investors. Looking at the area labeled “when to buy stocks and hold” on the chart of the K-wave in Figure 1, the two- to four-year margin of error suggests that 2019 to 2021 could be the end of the current correction (rather than 2023).

THE NEXT BULL MARKET?

There is no doubt that the S&P 500 index will start correcting in an upmove sometime in 2019 with the start of a major bull market. The Elliott wave count in Figure 4 is showing that the S&P 500 index could soon be falling in a Wave 5 of WAVE C.

With the dramas that are happening daily throughout the world, from Brexit to the US government shutdown to uncertainty in countries such as North Korea, Yemen, Afghanistan, and Iraq, surprises can happen at any time and news carries global influence in today’s world. President Donald Trump tweeted on December 26, 2018 that “now is the time to buy shares” and the same day the DJIA rose over 600 points. Thus, new reasons for volatility in the market are arising all the time. Given that, will the past success that Kondratieff had in forecasting movements of the stock market continue?

PRESIDENTIAL CYCLE

Looking at the presidential cycle in Figure 2, we can see that the stock market corrected before President William Clinton handed over the presidency to President Bush. We can see that the market collapsed before President Bush handed over the presidency to President Obama and that the market corrected before President Obama handed over the presidency to President Trump. Is the current correction suggesting that President Trump will be handing over the presidency to someone else in 2020?

CYCLE INDICATOR

Finally, the chart in Figure 5 is a monthly chart of the Dow Jones

Transportation Average showing the cycles indicator in Advanced GET. The cycles indicator calls for a bottom in August 2019. A look back at previous cycle tops and bottoms shows that the suggestions given by the cycles indicator have been reasonably accurate give or take a few months.

AN INTERESTING YEAR

There is no doubt that the year 2019 will be an interesting year for the stock market. The K-wave called for a correction to occur in 2019. The correction started on October 3, 2018.

The K-wave is also suggesting that the market should start recovering in 2023. As we have seen, history has shown that the recovery usually occurs two to four years earlier. This means that the recovery could start sometime in 2019 to 2020, as suggested by the cycle formation in Figure 5. The indexes plunged on Christmas eve 2018, which was the worst-ever

What Can We Expect?

Stocks Could Face A Challenging Year

What does 2019 hold for us? While there's no certain answer to that question until the year ends, we can at least look at some "big picture" indicators to make forecasts.

by Fawad Razaqzada

THE FUNDAMENTAL LANDSCAPE

So if that is anything to go by, February 2019 could potentially be a negative month for the US indexes. In any case, I think 2019 as a whole could be a year of high volatility. Unlike in the past several years when the only strategy that seemed to work was buying the dip, 2019 could be a year for both the bulls and the bears to enjoy.

In 2019, selling the rips might also become fashionable among market participants. The prospects for softer economic performance in the US and disappointing corporate earnings results could undermine equities. However, the rising levels of government spending in China and still-loose monetary policy from the likes of Bank of Japan and European Central Bank will help limit the downside. So both the bulls and the bears will have compelling reasons to make their presence felt.

The bears can point to growing signs that the US economy may have already peaked, and that the potential downturn could undermine corporate revenues and profits in the upcom-

A

fter a poor start, the US stock markets recovered noticeably to end the month of January 2019 higher. Sentiment improved mainly on the back of hopes that China and the US would end their ongoing trade spat and reach a deal in the months ahead. In addition, the Federal Reserve more or less announced that it will be pausing its hiking cycle following four interest rate rises in 2018. However, despite the sizeable rebound in January, I am not so sure we are out of the woods just yet. Indeed, between the two separate selloff periods in the fourth quarter of last year, stocks actually rose in November.

ing quarters. The recent currency crises in several emerging market economies have likely hurt demand for US and other developed economies' exports, made worse by the growing trade dispute among the world's largest economies.

Ongoing uncertainty about Brexit—the UK's impending departure from the European Union—also contributed towards slowing economic conditions both in the UK and Europe, as individuals and businesses put their spending plans on hold. In fact, Germany was on the verge of suffering a potential recession following the release of consistently poor economic data in recent months. The Eurozone's economic powerhouse suffered a contraction in its GDP in the previous quarter and so another quarter of negative growth would technically tip the nation into a recession. And with China's economy growing at its slowest pace last year since 1990, this doesn't bode well for Germany given that China is a large consumer of luxury German cars, among other things. With growth in both China and the Eurozone slowing, you have to wonder what that means for US exports. Domestically, the positive impact on the US economy of the past tax cuts is diminishing, while efforts to start the process of impeachment of President Donald Trump are an additional risk facing US investors.

Underscoring the above worries, Apple Inc. (AAPL), for example, has said that it is expecting a drop of up to 10% in its revenues for its current fiscal second quarter, which ends in March, as a result of falling iPhone sales in places such as China. We have seen similar warnings from a few other tech giants as well. If lower guidance becomes a trend, then it would become difficult for investors to justify holding stocks at these elevated levels.

But it isn't all doom and gloom out there—not yet anyway. The stock market correction at the end of last year could just turn out to be a large dip rather than a major trend reversal. The US economy may not weaken as I envisage it would. In any case, central banks will undoubtedly move in to limit any potential drop in the markets. Indeed, given the outlook for slower economic growth, recent falls in crude oil prices, and the impact of the past tax cuts falling out of the equation, inflationary pressures are likely to wane further in 2019, thus increasing the likelihood that the Fed will hold off raising rates further. Meanwhile, other major central banks will likely keep their respective policies accommodative.

TECHNICAL OUTLOOK

Still, from a technical perspective at least, the monthly chart of the S&P 500 (Figure 1) has shown a few longer-term bearish developments, suggesting we may have already seen the peak. After staging a false

break reversal at the end of the summer, when it failed to hold above the previous record high of 2872.87 (hit back in January 2018), the index has fallen sharply to break its old lows. At the time of this writing in late January, the S&P had rebounded to trade back around the point of origin of the previous drop between 2631 and 2700. If we see a breakdown on the lower timeframe charts around this potential resistance area now, then this could trigger another wave of selling in February.

Based on this alone, I certainly wouldn't rule out the prospects of a potential drop towards the 10-year-old bullish trendline in the upcoming months.

For now, the near-term path of least resistance may be to

Continued on page 31

FIGURE 1: THE BULL IS STILL INTACT. After breaking its old lows, the S&P rebounded to trade back around the point of origin of the previous drop between 2631 and 2700. If we see a breakdown on the lower timeframe charts around this potential resistance area, it could trigger another wave of selling.

Fractally Speaking

The US Long Wave Revisited

Want a long-term cyclical outlook for the US stock market? Here's one way to do it.

by Mark Rivest

R

alph Nelson Elliott discovered that stock market prices have repeatable patterns. He called this phenomenon *the wave principle*, now known as Elliott wave theory. He also found that this pattern was just one part of a larger pattern with the same structure. This larger pattern was again just one part of a still larger pattern and could progress to infinity. Form remains constant but size will vary. A one-hour price pattern could be part of a one-day pattern, which in turn could be part of a one-week pattern, theoretically growing into centuries.

My article “The US Long Wave” that appeared in the 2015 Bonus Issue of this magazine illustrated the long-term Elliott wave pattern of the US stock market based on economic cycles since the inception of the United States. This follow-up article focuses on the US stock market from 2009 to 2018 and where it could be within the long wave.

DOW JONES INDUSTRIAL AVERAGE: 100 YEARS

Finding the wave point of origin is the first step of Elliott analysis. For the US long wave, 1790 is the first full year the

United States operated under its current constitution. Prior to then, the states/colonies were a loose confederation and sometimes competed against each other.

For many reasons it's difficult to get an accurate Elliott wave count of stock prices prior to the 20th century. Fortunately, Elliott wave theory extends beyond the stock market and can be applied to any mass mind activity. My article “The US Long Wave” noted that the history of US economic contractions from 1790 to 1929 formed the basic Elliott wave pattern.

The Dow Jones Industrial Average (DJIA) 100-year chart in Figure 1 illustrates the basic Elliott wave pattern. There were three growth periods: 1932–1937, 1942–1966, and 1974–2000. Separating the growth periods are two contractions: 1937–1942 and 1966–1974. This is the basic Elliott five-wave pattern. A miniature version of this pattern can be seen in the bull market from 1932 to 1937. This five-wave rally was then followed by a three-wave correction. This growth contraction sequence is illustrated as Cycle waves “I” and “II,” which were the first two waves of a larger developing five-wave pattern that completed in the year 2000.

The 1932 to 2000 secular bull market is perhaps the largest Elliott wave ever accurately recorded for a stock market. It illustrates the theory of an ever-expanding wave pattern on a multi-decade scale.

S&P 500: 20 YEARS

Drilling down to a smaller time scale and a different stock index, let's examine the S&P 500 (SPX) for wave patterns after the year 2000. There are 10 different Elliott wave corrective patterns, two of which can exceed the correction's point of origin.

See the SPX monthly chart in Figure 2. This is an example of an Elliott wave *expanding flat* correction. The first wave of this correction is the 2000–2002 bear market. The second wave was the five-year bull market that ended in 2007. Note that this peak marginally exceeds the first-wave-down point of origin made in March 2000. Finally, the third wave 2007–2009 exceeds the low of the first wave made in 2002 and completes a nine-year Elliott wave correction.

This corrective pattern may also be giving clues that the next bear market may have begun in 2018 or could begin in 2019.

This corrective pattern may also be giving clues that the next bear market may have begun in 2018 or could begin in 2019. The red trendline that originates at the SPX March 2000 top connected to the SPX peak of January 2018 crosses the so-far

all-time high made in September 2018. The subsequent sharp drop could be the first wave down of a larger developing bear move.

Another trendline that begins at the SPX October 2007 top when connected to the January 2018 high implies a new high could be made at or above SPX 3,000 sometime in 2019.

Backing up the theory of a top formed in 2018 or forming in 2019 is the significant MACD bearish divergence, indicating weakening upside momentum.

FIGURE 1: THE BASIC ELLIOTT FIVE-WAVE PATTERN. On this 100-year chart of the Dow Jones Industrial Average (DJIA) you see three growth periods: 1932–1937, 1942–1966, and 1974–2000. Separating the growth periods are two contractions: 1937–1942 and 1966–1974.

FIGURE 2: EXPANDING FLAT CORRECTION. On this 20-year chart of the S&P 500, notice the first wave of this correction is the 2000–2002 bear market. The second wave was the five-year bull market, which ended in 2007. Note that this peak marginally exceeds the first-wave-down point of origin made in March 2000. Finally, the third wave 2007–2009 exceeds the low of the first wave made in 2002 and completes a nine-year Elliott wave correction. This corrective pattern may also be giving clues that the next bear market may have begun in 2018 or could begin in 2019.

FIBONACCI ANALYSIS

Projections for bull market termination points can be determined by Fibonacci extensions. The first step is to measure the length of the last most significant decline and then multiply it by a Fibonacci extension ratio. This amount added to the decline bottom will determine an approximate termination point for the bull move.

Some of the Fibonacci extension ratios are 1.236, 1.382, 1.50, 1.618, 2.00, 2.236, 2.382, 2.50, and 2.618. My article “The US Long Wave” had noted that near the end of 2014, the DJIA came close to a Fibonacci extension point. This was calculated by multiplying the length of the 2007–2009 DJIA decline (7,728 points) by 1.50, which equals 11,592; adding this to the DJIA bottom targeted 18,062 as a possible DJIA top. The actual DJIA high in December 2014 was 18,103. This is a difference of only two-tenths of a percent.

FIGURE 3: FIBONACCI ANALYSIS. The SPX 1.618 Fibonacci extension point was 2,138 and the actual SPX high was 2,134. Later in August there was a global mini-crash and it appeared to be the start of a large bear market. However, it turned out to be only the first wave down of an intermediate-size correction that ended in February 2016. The subsequent bull move went beyond several Fibonacci extensions with a 2.618 ratio or 3,047 as the next target.

FIGURE 4: THE 2009 WAVE STRUCTURE. The movement up from the 2009 bottom now looks like a completed five-wave Elliott structure. Note the pattern is replicated within Primary wave "3." Is a major top in place at the September 2018 top?

Later in 2015, this peak was exceeded, which opened the door to the next Fibonacci extension ratio of 1.618. In May 2015 the DJIA peaked at 18,351, not even close to the 1.618 ratio of 18,974. However, the SPX had a near bull's-eye hit. See the 2007–2018 SPX monthly chart in Figure 3.

The SPX 1.618 Fibonacci extension point was 2,138 and

the actual SPX high was 2,134. Talk about precision! Later in August, there was a global mini-crash and it appeared to be the start of a large bear market. However, it turned out to be only the first wave down of an intermediate-size correction that ended in February 2016.

The subsequent bull move went beyond several Fibonacci extensions with the 2.618 ratio or 3,047 as the next target.

In October 2018 the DJIA reached the area of its 2.618 extension. The ratio target was 26,702, or nine-tenths of a percent below the actual high. There are no rules regarding leeway for Fibonacci targets. Considering this calculation covers a period of several years, the wide leeway is acceptable.

Also note the significant RSI bearish divergence. This is further proof of waning upside momentum.

WAVE STRUCTURE 2009–2018

After the SPX high in May 2015, the rally from 2009 appeared to be a three-wave structure. If a major top was made at that time, the most likely Elliott wave structure would be an expanding flat. This would be another example of a smaller component having the same structure of the larger whole structure. In this case, the smaller component is the 2000–2009 expanding flat being the first wave of the larger expanding flat. The entire structure could have culminated with a multi-year decline following the May 2015 peak.

There's no predestination in any market. The mass mind can, like an individual, change. The 2015–2016 decline became an intermediate-degree correction, changing the wave structure from the major 2009 bottom. See the monthly SPX 2009–2018 chart in Figure 4.

The movement up from the 2009 bottom now looks like a completed five-wave Elliott structure. Note the pattern is replicated within Primary wave "3."

The big question: Is a major top in place at the September 2018 top? There are reasons to be suspicious. First, markets tend to gravitate toward round numbers. The SPX high in

September was 2,940; it's curious that it couldn't reach the tantalizing 3,000 target. Second, there's a strong seasonal pattern for US stocks to rally from November to May. Third, the daily wave structure after the January 2018 high has been choppy—a signature of a corrective pattern. (See my various *Traders.com Advantage* articles at this magazine's website, traders.com, for a detailed explanation of the SPX 2018 price pattern.)

On the bearish side of the coin, the monthly slow stochastic lines have a bear cross, implying more downside action. With a mixed picture perhaps, the answer can be found in the time dimension.

TIME DIMENSION

How long can a stock bull market continue? Some analysts believe a bull market begins after a 15% decline. Others use declines of greater than 25%. The SPX rally from 2009 to 2018 has some interesting parallels to the 1990–2000 bull market. Both markets had only one correction greater than 20%. The 1990–2000 bull had a 22.4% correction in 1998. The move up from 2009 has so far had the 2011 decline of 21.5%. The 1990–2000 bull market was nine years and five months long. The bull market that began in March 2009 was nine years and five months old in August 2018. It continued higher into September and then had a sharp October drop. Perhaps the bull market is complete as of September 2018... or is there a later time target the SPX could reach?

As noted earlier, US stocks have a strong seasonal pattern from November to May. The 10-year anniversary of the current bull market would be in March 2019. If the seasonal pattern is functioning, this is the more likely endpoint for the bull market.

Could the bull market continue to 2022? Instead of using 1990 as the start date for the bull market, if you used 1987 as the beginning point, this would be a 13-year bull market with two corrections greater than 20%: the 20.3% decline in 1990 and the 1998 correction. If the SPX decline that started in September 2018 developed into a 20% correction, the bull market could continue to 2022.

LONG-TERM CYCLE

In the last quarter of 2018, there is enough evidence to suggest the US stock market could be at or near a significant top that could hold for several years. Upside momentum is weakening. Five waves up from the

Is a major top in place at the September 2018 top? There are reasons to be suspicious.

major bottom made in 2009 could be complete. Historical comparison suggests the bull market from 2009 is old. Even if it continues into early 2019, you need to prepare for a possible large decline.

Figure 5 shows the US long wave completed count scenario. This is the worst-case scenario: a multi-decade decline for the US stock market. In this wave count, the SPX at a minimum would need to go below the major bottom at 666.79 made in 2009.

An alternative scenario is shown in Figure 6, the US long wave incomplete-count scenario. Based on time proportions between the two prior Super Cycle–degree bull markets, I believe this is the more likely scenario. Super Cycle wave (I) was 139 years, 1790 to 1929. Super Cycle wave (III) was 68

Continued on page 31

FIGURE 5: THE COMPLETED COUNT SCENARIO. This is the worst-case scenario: a multi-decade decline for the US stock market. In this wave count, the SPX at a minimum would need to go below the major bottom made in 2009 at 666.79.

FIGURE 6: AN ALTERNATIVE SCENARIO. Based on time proportions between the two prior Super Cycle–degree bull markets, this may be the more likely scenario.

It's Just An Estimate

Forecasting A Market Recovery After A 10% (Or More) Correction

Market declines can cause the powerful emotions of fear and greed to take over our decision-making abilities. When you notice that happening, try to think rationally.

by Gideon Vigderhous, PhD

When a market declines more than 10%, it's reason enough for investors and traders to be concerned. Do you hold your positions and ride out the drop even if it gets worse, or do you exit your positions and reenter after the market has begun its road to recovery?

DOWN THE QUANT PATH

I developed a statistical model to determine the recovery time for the stock market using the S&P 500 stock index. I took

into consideration the percent of the decline, the length of the decline, and the level and change in Fed interest rates. Based on my analysis, I found that changes in interest rates and their level can't accurately forecast the market's decline.

Let's look closely at the recent market correction, which started moving into correction territory on September 10, 2018. The S&P 500 was at 2,930 and as of October 26, 2019 it declined to 2,658. That's a little over 10%. To forecast the time of recovery of the recent decline, I analyzed historical data to estimate the lengths of recovery time. I used data from the CNBC.com article "The Stock Market Loses 13% In A Correction On Average, If It Doesn't Turn Into A Bear Market" from October 26, 2018.

Simply observing historical data when the market declines 10% or more would be incomplete without considering the changes in interest rates during the decline period. To forecast

the time of recovery, you would have to build a statistical model that will take into consideration the following factors:

- Percent decline
- Duration of decline, in months
- Change in interest rates
- Interest rate levels

I used a *poisson regression*, which is a generalized linear model form of regression analysis that is typically used to predict values. It is used to model count data. (I used poisson because we are using non-negative numbers, or the number of days it takes the market to recover.) In this case, I will predict the number of months for recovery using the factors I just mentioned. The table in Figure 1 presents the results of the poisson regression analysis.

THE ANALYSIS

From Figure 1 you can learn that all the factors considered in the model were very statistically significant. The percent decline has the highest relative importance, which suggests that the larger the percent decline, the longer the recovery time will be. The second most important factor is the change in the interest rates from the Federal Reserve. It is interesting to note that a change in Fed interest rates is a negative factor and shortens the recovery period. At today's Fed rate levels, it won't make a significant impact on the recovery time.

The correlation between the model forecast and actual time of recovery was 0.98, which is almost perfect.

I used the model to forecast the recovery time from a recent market decline of 20%, where on November 7, 2018, the S&P 500 was at 2813 and on December 24 it was at 2351. The forecast indicated that it would take

Recovery	Coef.	Std. Error	z	P>z	At low, 95% confidence	At high, 95% confidence
Length of decline	0.0401	0.0095	4.24	0	0.0216	0.0586
% Decline	0.0564	0.0057	9.91	0	0.0453	0.0676
Change in Fed rate	0.0881	0.0176	5.01	0	0.0537	0.1226
Fed rate	-0.0453	0.0232	-1.95	0.051	-0.0908	0.0003
Constant	0.6073	0.1995	3.04	0.002	0.2162	0.9983

FIGURE 1: MARKET RECOVERIES AFTER CORRECTIONS. The percent decline has the highest relative importance, which suggests that the larger the percent decline is, the longer the recovery time will be. Fed interest rate changes are a negative factor and shortens the recovery period.

six months to recover the percent loss. (See sidebar, "Historical Data Of Market Decline And Recovery.")

It has become a common argument in the financial media that an increase in interest rates is to blame for the market's

* Fed rate at beginning of period ** Fed rate at end of period

decline. Statistical analysis indicates that we couldn't forecast market declines from changes in interest rates. Interest rate increases can affect the length of recovery, but can't forecast how large declines will be.

SUMMARIZING

In summary, I developed a model to forecast the length of time the market will take to recover after a correction, using historical data. The most recent forecast, as of this writing on December 28, 2018, is that the market will recover in six months, if the market does not decline further. The greater the market decline in percentage terms, and the longer it takes to decline, the longer the market takes to recover. The level of interest rates and their percent change can't accurately forecast the market's decline.

Gideon Vigderhous has a PhD in statistics and was chief statistician for many years at Reader's Digest. He currently works with DRD Investments. The main focus of his work is developing econometric models to forecast corporate earnings and identify those stocks that will most likely beat Wall

Interest rate increases can affect the length of recovery, but can't forecast how large declines will be.

Street's expectations. He may be reached at fcarnings@gmail.com.

MORGAN/WHAT'S CONTROLLING THE MARKET

Continued from page 10

where it's been, and it knows where it's going." This profound statement is now mathematically proven. I doubt if there is any other financial fractal that is as mathematically beautiful as this one. These relationships are not the result of using filtered or smoothed data. This is real, raw, unadulterated data. The universe is mathematical and so is the market. This is anything but a random walk with an upward bias, which decades of Wall Street dogma has suggested. In my opinion, no market theory comes close to the Elliott wave theory in explaining how the market behaves.

There have been many Wall Street pundits who have derided the DJIA as outdated and archaic, saying it should be retired to the dustbin of history. In reality, with its long history, it is the best index to analyze in order to gain deep insight to the behavior of the market.

Looking at the fractal movement gives us a glimpse into the real nature and character of the market, and the tool that can provide that glimpse is Elliott wave theory. It's as if an algorithm is running in the background. The question is, "Who is behind the curtain controlling the destiny of the DJIA?" or does it have no master and it just plods along silently running until the end of time?

BEYOND 2007

The perfect Dow fractal appears to be embedded within a larger fractal (see Figure 10). The wave down from 14,280 to 6,440 (7,840 points) is related to the move down from 11,908 to 7,178, which was 4,730 points. $4,730/7,840 = 0.60$, which is a common relationship between waves. Also, by dividing the magnitude of these two waves, the result is $2.217/1.658 = 0.75$, another common relationship. Therefore, these two waves are part of an ABC pattern. Primary wave 5 started from the end of the ABC and ran from 6,440 to 27,064. The length of this wave is $27,064 - 6,440 = 20,624$. The length from the start of Primary wave 1 to the 14,280 top was $14,280 - 570 = 13,710$. And $20,624/13,710 = 1.50$, another common ratio. More importantly, with the Cycle V peak at 27,064, another near-perfect mathematical relationship can be established as shown in Figure 11.

Notice that every other major peak since the Cycle I top in 1937 is related by some power of 2.28 all the way to the final peak of 27,064 on October 3, 2018. The only one not showing

FIGURE 11: BIG TOPS ARE ALL RELATED. Every other major peak since the Cycle I top in 1937 is related by some power of 2.28 all the way to the final peak of 27,064 on October 3, 2018.

this relationship is the adjacent peaks of Cycle I and Cycle III, which was a 2.26^2 relationship, which would have been a 2.28^2 relationship if the Cycle III top had ended at 1,015 instead of at 1,001.11 (we saw this earlier). Here is the math:

$$11,908 / 1,001.11 = 11.89 = 2.28^3$$

$$14,280 / 2,747 = 5.198 = 2.28^2$$

$$27,064 / 11,908 = 2.272$$

A BEAUTIFUL DANCE PARTNER

This cannot be random! An algorithm is at work here and it is clear that 2.28 is the most important ratio, the cosmological constant if you will, in the whole history of the DJIA since the 1932 bottom, along with its first cousin, 1.205. These repeatable mathematical relationships bring a beautiful order and understanding to the seeming chaos of the market. The DJIA is clearly moving in a mathematically prescribed path, just as the planets are orbiting the sun in a mathematically prescribed path. Is something controlling the market? Obviously. Is the random walk alive and well? Hardly!

Eric Morgan graduated from Purdue University with a degree in electrical engineering and is an electronics engineer with Kratos Defense working at the Naval Surface Warfare Center at Dahlgren, VA. He is a longtime practitioner of the Elliott wave theory. He can be reached at morganed@verizon.net.

TRADERS' GLOSSARY

Confidence level—The degree of assurance that a specified failure rate is not exceeded.

Elliott wave theory—A pattern-recognition technique published by Ralph Nelson Elliott in 1939, which holds that the stock market follows a rhythm or pattern of five waves up and three waves down to form a complete cycle of eight waves. The three waves down are referred to as a "correction" of the preceding five waves up. Fibonacci ratios are applied to the price spans and price targets may be projected.

Fibonacci ratio—The ratio between any two successive numbers in the Fibonacci sequence, known as phi (ϕ). The ratio of any number to the next higher number is approximately 0.618 (known as the golden mean or golden ratio), and to the lower number approximately 1.618 (the inverse of the golden mean), after the first four numbers of the series. The three important ratios the series provides are 0.618, 1.0 and 1.618.

Fibonacci sequence—The sequence of numbers (0, 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89, 144, 233...), discovered by the Italian mathemati-

cian Leonardo de Pisa in the 13th century and the mathematical basis of the Elliott wave theory, where the first two terms of the sequence are zero and 1 and each successive number in the sequence is the sum of the previous two numbers. Technically, it is a sequence and not a series. Prices sometimes tend to find support or resistance at points indicated by this series.

Golden mean or golden ratio—The ratio of any two consecutive numbers in the Fibonacci sequence, known as phi and equal to 0.618; a proportion that is an important phenomenon in music, art, architecture, and biology.

Kondratieff, Nikolai—Developer of a wave theory. The Kondratieff wave is a 54-year rhythm of wholesale prices, politics, and culture.

Regression analysis—A method of comparing two investment variables to determine an independent variable's impact on a dependent variable, with the end result providing a prediction on future performance.

2019 Readers' Choice Awards

We are pleased to present the *Technical Analysis of Stocks & Commodities* magazine 2019 Readers' Choice Awards (RCA). Each year, we put before our readers a ballot of products and services related to technical analysis and trading. The following pages present the products and services you and your peers chose this year as your favorites.

The Readers' Choice Awards begins each year with a list of products gathered by the editors of STOCKS & COMMODITIES, with space for write-in votes (given that our list doesn't claim to be complete). Then, to find out what our readers find to be the most useful for their trading, we ask them to choose their favorite products or the ones they find most useful from various categories by going to our website, **Traders.com**, and filling out the survey there. After that, we compile the results, just in time for the Bonus Issue you hold in your hands.

Products are categorized by their primary purpose. Just because a service or product is not listed does not necessarily mean that the product does not have features germane to the category. In addition, some categories are divided by cost so that the comparisons can be made on a more level playing field.

The winners in the Readers' Choice Awards are almost always the dominant players in their niche, and rightfully so. You may have special needs for your trading, however, so you should keep in mind those products that are not the big names in the category of your interest before you make your final decision. The RCA is designed to be an aid for you when you are deciding on which of the numerous products and services currently available to use for your trading and investing. With that in mind, we think you'll find the Readers' Choice a terrific guide to products and services that you'll be interested in.

TRADERS.COM ADVANTAGE

THE FOREMOST COLLECTION FOR TRADERS

This massive collection packages the best tools for trading and investing in *any* market!

1. *Technical Analysis of STOCKS & COMMODITIES*, the Traders' Magazine™. The premier magazine for technical analysis. You'll get **five years** — 65 issues — including our annual Bonus Issues with our Readers' Choice Awards.
2. *S&C Digital Edition*. Recent complete issues available in their entirety as PDFs for you to either download or read directly in your browser. No more waiting for the mail to deliver your magazine! You will still receive the printed magazine unless you opt for a digital-only subscription.
3. *Complete Digital Archive*. The complete archives as PDFs — more than 17,000 pages — from *Technical Analysis of STOCKS & COMMODITIES* from 1982 through the present. The articles can be read in your browser or download to your computer (or any device with Internet access and the ability to read a PDF)!
4. *Traders.com Advantage*, premium website content delivering real-world technical analysis to you! You'll get **five years** of charts, indicators, and “how-to” advice for specific markets, currencies, stocks, and commodities; near-term opportunities; price movement; new techniques. Posted in real-time with an archive of thousands of articles.
5. *Working Money*, the Investors' Magazine online. You'll get **five years** of market observations; explanations of charts, markets, and market sectors; money management; and interviews with money people that will help you trade and invest wisely.
6. *Article Code*. Download or copy & paste code presented in past issues of *STOCKS & COMMODITIES* — no need to type it out manually.
7. *Optimized Trading*. The optimized indicator values can be used as starting points when trying to decide what values to input into your charting software. Search for a certain symbol or company or build your own portfolio.

ALSO RECEIVE A FREE[†] BOOK WITH YOUR PTSK ORDER!

Charting The Stock Market: The Wyckoff Method, edited by Jack K. Hutson, is yours free[†] with your order for the Professional Traders' Starter Kit.

[†]Shipping and handling charges apply for foreign orders.

TECHNICAL
ANALYSIS OF **STOCKS &
COMMODITIES**

www.Traders.com

*Based on the 5-year subscription rate of \$299.99. Shipping extra for foreign addresses.

TRADERS' RESOURCE

TOP 10 VIEWED SOFTWARE LISTINGS

In this day and age, the choice of software with which to analyze and interact with the markets is rich, with different packages offering different capabilities, methodologies, and price ranges to fit every style of trader.

Are you interested in a basic software package, but also find that you need to write custom indicator formulas? Are you interested in ranking, screening, and producing a list of candidates based on your favorite technical indicators? Or are you a daytrader, a position trader, or a professional trader? Are you looking for software to run from your hard drive, or do you prefer to rely on your Internet connection for interactive analysis?

Software packages for each of these needs are out there, but tracking them down can be daunting. To help STOCKS & COMMODITIES readers make the right choices for themselves, we surveyed the industry and collected the responses. The top 10 list is shown here, with expanded information available at our website.

In this listing, resellers of software may be included, so software is not always listed by developer.

TRADERS' RESOURCE AT TRADERS.COM

At our website, **Traders.com**, you'll not only find out more about the software listed here, but you'll also find information on products and services in other categories, such as brokerages, mutual funds, data services, trading systems, hardware, seminars, books, con-

Product	Company
1. ASCTrend Indicator	AbleSys Corporation

For more information about our advertisers, go to **Traders.com/reader** where you will find the alphabetized list of this month's advertisers. For reference, the list is also printed above along with the corresponding page number for each ad. Just follow the simple directions below and the advertisers will get your requests the same day!

STEP 1: Go to **Traders.com/reader** and scroll through the list of our current month's advertisers.

Click the box for each advertiser you'd like to hear from. At the bottom of the list, click **Continue** when finished.

STEP 2: Fill out your contact information and click **Send Request**. Your request will then be sent to the advertisers you selected. And that's it!

The screenshot shows the 'Reader Service Listing' on the Traders.com/reader website. It features a list of advertisers with checkboxes next to them. Below the list is a contact form with fields for 'First Name', 'Last Name', 'Email Address', 'Company', 'Phone', and 'Fax'. There is also a 'Send Request' button and a 'Continue' button.

Based on *Technical Analysis of Stocks & Commodities* magazine 2019 Readers' Choice Awards; in each award category, results are based on the company that receives the highest number of votes cast by the magazine's subscribers over a fixed time period that ends shortly before announcements of the awards. No offer or solicitation to buy or sell securities, securities derivative or futures products of any kind, or any type of trading or investment advice, recommendation or strategy, is made, given or in any manner endorsed by TradeStation. All proprietary technology in TradeStation is owned by TradeStation Technologies, Inc. Equities, equities options, and commodity futures products and services are offered by TradeStation Securities, Inc. (Member NYSE, FINRA, CME and SIPC). TradeStation Securities, Inc.'s SIPC coverage is available only for equities and equities options accounts.
