Final Advice & Q&A

About me

I've been in this industry since around 2006. I started out as a sub-broker

for the first few years, but I found the work monotonous and wasn't really enjoying it. That pushed me to explore the research side & I wanted to understand how stocks actually move.

In the early years, most of my learning came from YouTube. But while it gave me a foundation, it didn't teach me anything about risk management. Most of the content was theoretical and not very practical.

Things started to change when I came across Mark Minervini's books. That's when my understanding of risk and overall market outlook really shifted.

Today, I don't trade exactly like him, but the core principles I follow are quite similar.

My Trading System in a Nutshell

Target Moves

I go for 20-40% moves

Allocation Strategy

Allocation of 10-30%

Stop-Loss Approach

Average stop of 2-2.5% and go as low as 0.5% stops

Fear management

Most people start by learning technical analysis⁴ I did the same. But now I feel this is the wrong way to begin.

Why? Because it makes you believe that technical analysis is the most important part of trading or investing. In reality, it's just a small piece of the puzzle.

If you're scared to invest, even a small drop in the market can shake your confidence and make you quit. In such moments, technical analysis won't save you.

That's why the first skill to build is learning how to manage fear.

And the only way to do that is to **start small** ⁴ and slowly increase your exposure over time, just like progressive overload in the gym.

Environment Analysis

Ever wondered why some weeks your trades consistently succeed while others fail despite using the same strategy?

The answer lies in the **market environment** 4 the overlooked yet critical factor determining your swing trading success.

Beginners often obsess over individual stock setups while neglecting market conditions. This fundamental oversight can sabotage even the most promising trades.

In unfavorable market conditions, **75% of stocks will underperform**, regardless of how perfect their technical patterns appear.

Classic patterns like the **cup and handle** yield dramatically different results in a fresh bull market versus a mature, extended trend that's been running for months.

To elevate your trading performance, master reading market environments first 4 then apply your stock-picking skills.

My Bread and Butter Setup

Identifying High-Potential Stocks at the Seed Stage

The ideal setup I look for follows this specific pattern:

- Stock with a solid prior uptrend

- Followed by a shallow correction (less than 30%)

- Price action reclaiming the 20-day moving average

This pattern consistently identifies stocks poised for significant momentum shifts before major moves begin.

Entry Technique: SVRO

UpgradeofSS (Strong Start)

This technique focuses on trading days that start with strong momentum. It helps you enter positions early before the crowd jumps in and before the breakout becomes obvious.

Position Sizing Strategy

Conservative Risk Management for Asymmetric Returns

I maintain strict position sizing discipline by risking only a small portion of my portfolio on each trade:

Maximum risk per trade: **0.5% of total portfolio**

Average risk per trade: **0.25% of portfolio**

Stop-loss range: **2-3% from entry price**

This conservative approach translates to an allocation of **10-30% of available capital** per position, protecting my portfolio while allowing for meaningful gains.

Exit Rules

Sell when it hits your stop or when it gets super extended. No inter ference.

Final Advice for Different Trading Stages

For Absolute Beginners

Change your objective from making money to **surviving your first year**. Focus on building experience and preserving capital rather than chasing profits.

For Intermediate Struggling Traders

Study your psychological patterns carefully. Identify which troubles you more:

- Watching substantial open gains evaporate to zero, or

- Seeing a trade you exited continue much higher without you

Then create exit rules that help you deal with the emotions you struggle with the most.
